You're right, it's not right! :-)

A dBm is simply decibel's referenced to 1 milliwatt. There is no impedance specified, or implied.

>Can anyone tell me when the peak of the Perseids meteor shower is supposed to
>peak and in which direction is the best to look for them? Thanks.

Perseids will peak at about 01 UT on August 12th. The "normal" peak of
Perseids will appear about 14 hours later. This info is based on radio
measurements done last year by a friend of mine.

Ready for Perseids ?

Compact Ms-soft PC V4.1 by OH5IY is available at funic.funet.fi by anonymous ftp. Path: pub/ham/vhf-work/mssoft41.zip.

A real dream program. Main features:
- Peak time predictions
- Efficiency calculations
- CW-transmit (high speed)
- Sked editor
- Autolog

Good reflections,

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July weekly
August bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

8. RACES Bulletin #285

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-01 16:48:32 UTC
From: enge@almaden.ibm.COM
Message-ID: <9308011648.AA22308@ucsd.edu>
Source record: 278538

Bid : $RACESBUL.285

TO: ALL EMERGENCY MANAGEMENT AGENCIES VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES
(KH6GBX @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832
(916)262-1600
Landline BBS open to all: (916) 262-1657
RACESBUL.285 DATE: August 2, 1993

SUBJECT: OPS - Familiarization and the EOC

In an emergency the fire chief, police chief and mayor don't
go to a home and run things from there, but to the emergency
operations center or designated command post.
So it is with communications reserve participants. They are
expected to go to the government's communications facility and to
other locations that need such support. A home based station is
of little use in those situations.
Going to the place where they will be functioning helps
familiarize them with not only the equipment, but the place and
the people. If they participate only once in a while they really
don't understand their role and relationship to the agency. They
need help in understanding how regular participation is indeed a
joint recognition of their worth. After all, if they don't come
in regularly to help as help is needed, how can they get to know
us; or we, them?
Familiarization has many facets, from learning to use
equipment, to what systems do what, to discovering a radio that
interferes with the telephone system, or a computer that doesn't
work, or a secretary who doesn't know their name; or an agency
person who doesn't know there is a RACES unit. Or an Amateur who
is an unrepresentative example of those who DO participate on a
professional level.
Communications reserve participants need to become a
familiar face at the emergency response agency. Help them tackle
needed tasks and prove worth - NOW - long before it is needed.
Then, when it is needed there will be mutual benefits that all
will share. Yes, this may take a change of attitude to
accomplish, but humans have that characteristic: we can change!

9. external AM antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-01 17:08:34 UTC
From: brendan@june.cs.washington.edu
Message-ID: <BRENDAN.93Aug1100834@june.cs.washington.edu>
Source record: 278328
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

I am a displaced Canadian, living in Seattle and would like to be able
to pick up CBC's AM broadcasting from Vancouver, about 120 miles north.
If the atmospheric conditions are right, I can pick up a weak signal
with an ordinary radio, if not it is virtually impossible. I would
like to buy/make a stronger external AM antenna for my receiver and
would really appreciate any advice/suggestions from knowledgable net-folk.
I tried a cheap ($20) AM/FM antenna from Fred Meyer which improves things
a bit but not enough. Will post a summary of responses.

Thanks in advance,

Brendan Mumey

Hello

Does anyone of the UK readers know Rick, G4BLT ?? I'm trying desperately
to send him a file via packet-radio, but it seems that all the bits
disappear in the North-Sea bucket between G and PA.
If so, I would like to sent you the file, and then you can pass it on to
him (he has no access to this net :-( )

Thanks a lot.

I was about to purchase a Kenwood TM-241A, but the owner had a lightning strike and so the radio is no longer avail. It would have come with the RC-20 remote control head, I was very interested in the pair so I could mount the head in the truck and take the radio inside with me at night. So I'm trying to find out if there are any other options like this one avail.

Also, is the IF-20 interface unit still available (to connect mutiple single band Kenwoords to the RC-20), or was it discontinued like the RC-20?

Any info on detachable face 2M mobiles or such would be helpful.

Thanks,

Joe Reid

Congratulations, Dan, and very good luck with your candidacy. I am
running against an incumbent who appears only during election years
and who seems to avoid long range thinking.

However, I am not going after our Section Manager, who does a quite
creditable job. I am filing nomination petitions for Delta Division
Director, and seek to add some technical understanding and knowledge
(and access to the collective wisdom of the 'Net at the Board of
Director level ;^).

The process will be difficult, too, for the incumbent, while far
younger chronologically than I, is everything Wayne Green calls an OF,
and I like to believe there is much yet for me to learn.

Best of Luck... Hope to see you in Newington or elsewhere.
Join up and help us change things for the better!

[It's Hamfest Time Again!]

28th Annual Melbourne (Florida) Hamfest

Saturday and Sunday - September 11/12

Melbourne Auditorium on Hibiscus Blvd. (first stoplight north of US 192)
just west of US 1 - about 3 blocks. Talk-in on 146.25/.85 repeater.

Registration

$4.00 advance/$5.00 at door per person, both days.
Please include a self-addressed stamped envelope for advance
tickets - otherwise tickets will be held at door.

Swap Tables

150 swap tables available in air conditioned auditorium
$10 one day/$15 both days
Limit 2 adjacent tables per request

Make check payable to PCARS (Platinum Coast Amateur Radio Society)
for table fee plus registration ticket(s) fee and include
self-addressed stamped envelope. Send all that to:

Melbourne Hamfest
Gus Williams, N4UDL
511 Eleutheria Lane
Melbourne, FL 32937

Outdoor Tailgating (in front of the Auditorium)

First 10 feet free. One registration ticket required for each
additional 10 feet. (this is a change from last year).

Hotel Accomodations

Melbourne Hilton, 200 Rialto Place, Melbourne, FL 32901-3092
(407) 768-0200, FAX (407) 984-2528
Hotel is 4 stoplights west of hamfest on Hibiscus Blvd.,
then north on Airport Road to 2nd stoplight.

$50.00/room - mention hamfest.

Transportation will be provided between the hotel and the hamfest.

Commercial Booths

35 commercial spaces. Please write for more information and include your phone number.

Programs

* Phase 3D Amateur Radio Satellite overview by Dick Janssen, WD4FAB (saturday?)

* Overview of current OSCAR Satellite operations by Reid Bristor, WA4UPD (saturday?)

* VP8SSI DXpedition presentation by Al Hernandez, WA3YVN (saturday?) (Al was one of the operators at VP8SSI in the South Sandwich Islands)

* DX Cluster users meeting by Eric Smitt, K9ES, and Skip Rockwell, K3ARV (saturday?)

* Florida Phone Traffic Net Luncheon on Saturday

* Florida Traffic Handlers Breakfast on Sunday

* Military Affiliated Radio System Meeting (no day given)

* Lightning Protection Seminar presented by Burt Bittner, K0WGN (no day given)

[i'm going to say the "no day givens" must mean the meetings/presentations are on Saturday. The road map is missing as well. The following disclaimer is really on the flyer - i find it funny given that the flea market is the big attraction to this show. - bill wb9ivr]

NOTICE: In support of FCC regulations prohibiting the sale of uncertified equipment and illegally modified electronic equipment, PCARS will not tolerate or permit this activity during the hamfest.

==========

The Space Coast Amateur Technical Group will be putting on the Unbanquet Saturday night of the hamfest. Details will be announced at the hamfest - look for the flyers. Probably Ryan's Steak House on Babcock Street south of Florida Institute of Technology again ... 7 PM probably. Last year we were honored by the presence of Mach 25 recording artist Fred Becker - quite possibly he could be back since the Filbert/Becker "Enterphase" project should be released right around then. It was fun and expect it to be so again this year.

> Yeah, but there's another rule that says they have to be eighteen
> years old, isn't there? (Or is that just Volunteer Examiners?) :-)

Actually, Joel, the By-Laws (#13) of the ARRL say that:
"13. No person shall be President...<exhaustive list of offices>...or
Vice Director of the League unless, at the time of nomination, he
(sic) has reached his (sic) 21st birthyday and is..."

And the incumbents wonder why they are thought of as an "Old Boys
Club"? According to the By-Laws, Q. E. D., they are! ;^)

And, as a new director (I am running for Delta Division Director,
attempting to bring new ideas and new life to replace the silence of
our incumbent) I pledge to REMOVE any and all gender-specific language
in the ARRL Articles of Association and By-Laws...

This is going to be fun! ;^)

|>

the favored postion is probably more northeast, but if you think about this
and you should, it probably doesn't matter. it's a matter of 3D geometry.

i think, all those who are concerned, might request in their county, that
for the one night, all the billboards be turned off. call the owners,
and call the advertisers and request if it would be possible for them
this one night of the year to reduce the light pollution on this planet.
not all the meteors will be that bright. give the kids of this planet
an opportunity to witness this event first hand. it'll be their
only chance.

i happen to live in denton county texas. it has more billboards per capita
than any other place in the world. one of the nicest things that i enjoyed
when visiting the company headquarters for alliant computer systems in
acton MA aperiodically for three years was the fact that the boston area
has a law and/or ordinance against billboards in the burbs. nice going
MA. anybody in 2 land wanna make a comment on this. am i right?

i'm envious of those on the net that will be in CO UT and the less populated states away from light pollution. enjoy this night like i'm sure you enjoy all the others. i just may have to go to red river NM for one day just for this event. ;-)

enjoy,

p.s. i'm still predicting rain and/or cloudy skies in texas even though we've just set a record for no rain in july for the first time in about 100 years. we're all having problems.....

we're rationing water down in my part of the burbs.

Amateurs honored

Three more radio amateurs have had their names inscribed on a
monument at ARRL Headquarters for giving their lives during public
service activities. They are:

Robert V. Allard, KA1SJE, who died August 18, 1991, during the Ocean
State (R.I.) Bike Trek;

Herbert P. ''Doc'' Engelman, KD4OZY, who was killed by lightning on
September 2, 1992, while doing communications duty in Florida
following Hurricane Andrew;

Shirley Emmerich, N9JKB, who died February 16, 1992, during a search
and rescue drill.

Already honored on the monument were WD4DFK, W6TQF, W7KCM, KA7AMF,
K5YLU, and N5MOR.

The ARRL Letter

Vol. 12, No. 14

July 24, 1993

Amateur Radio "business rule" to change

At ARRL's request

clarifies what

communications OK

The FCC has amended its rules to allow amateur

operators more flexibility to provide communications for

public service projects and to "enhance the value of the

amateur service in satisfying personal communications

needs."

The new rules are based on a Commission proposal

announced in a Notice of Proposed Rulemaking in July, 1992,

a proposal resulting from an ARRL request. The League at

that time suggested that new language for the rules would

permit amateurs greater flexibility in providing

noncommercial communications while maintaining the

traditional character of Amateur Radio by continuing to

prohibit routine business communications.

In fact, the FCC in its Notice said "the League's

suggested proposal appears to best consolidate the views of

the amateur community (and) as noted by the League the

amateur radio community has a long tradition of self-

regulation and a strong commitment to maintaining the

unclouded distinction between the amateur service and other

radio services."

The Commission in announcing the rules change (in PR Docket 92-136) said the new rules would permit amateurs to "facilitate events such as races and parades, to support educational activities, to provide personal communications such as making appointments and ordering food, to collect data for the National Weather Service, and to provide assistance voluntarily even where there are other authorized radio services available."

The FCC stopped short of granting an ARRL request for further definition of acceptable communications, particularly in the difference between a regular and an irregular event, saying that providing such anecdotal examples "would necessitate that the FCC intrude upon the day-to-day functioning of the service to a far greater degree than desired." The FCC said that generating a list of the thousands of possible examples would unduly tax the Commission's staff.

The wording of the new rules is not yet available; the new rules will not be in effect until 30 days after they are published in the Federal Register. The full text of the FCC's NPRM is in September 1992 QST, page 62; the rules as adopted are not expected to be materially different.

Amateurs assist in Midwest floods

By Chuck Gysi, N2DUP

When flood waters ungulfed the U.S. Midwest -- particularly Iowa -- earlier this month, Amateur Radio operators were ready to pitch in with support communications. The entire state of Iowa -- all 99 counties -- was declared a federal disaster area, as well as many

counties in neighboring states.

As daily downpours pelted most of the Hawkeye State, already-swollen rivers were sent well over flood stage in many communities. The flooding along the Mississippi River attracted national media attention, as well as the problems that plagued the capital city of Des Moines after flood waters swamped and contaminated the city's water treatment plant. The problem eventually resulted in the loss of water for 250,000 residents for many weeks.

In fact, at one time Amateur Radio was the only link from inside Des Moines' besieged water treatment plant and those on the outside, as hams relayed information from inside the submerged facility.

In most river communities, Amateur Radio wasn't necessarily pressed into service, because flooding didn't knock out communications circuits. While many towns and cities dealt with flooded downtown streets, business and homes, most telephones and governmental radio services remained in operation.

However, the magnitude of the flooding that resulted when the Raccoon River overflowed in Des Moines resulted in the placement of more than 100 Amateur Radio operators in various roles.

Chuck Willoughby, KA0VBA, is the ARRL district emergency coordinator for nine counties in Central Iowa. He said hams became involved to support governmental operations. The Greater Des Moines FM Club's repeater on 146.820 was placed into service as a link between emergency operating centers (EOCs) set up at various sites. Net control was set up at the county EOC at the Polk County engineer's office.

In addition, hams were stationed at EOCs set up by the city at East High School, by the state at the Hoover Building, and by the fire department at its dispatch center. Two hams were stationed at both the city and state EOCs because the hams often were used to track down officials. While one ham remained on the air the other would pass messages to officials at the EOC. There were as many as 100 officials at the city EOC at times.

In addition to handling traffic over the 2-meter repeater, hams at the county EOC also manned the U.S. Army Corps of Engineers' radio at that location. The Corps was short on manpower and the hams pitched in on the Corps' frequency.

One essential service performed by the hams during the flooding was to log river readings in the area. Chris Charron, WB0RSW, said he was one of those hams who radioed river level readings, particularly after a critical instrument failed on the Raccoon River near Van Meter, Iowa. Charron said he set up a generator at the location to light up the area where he was logging readings through the night.

In addition to assisting governmental officials, Des Moines area hams also set up a net for the American Red Cross, to enable its mobile food units to have wide-area communications coverage throughout the metropolitan area. The Red Cross canteens fed not only flood victims, but also the thousands of volunteers who pitched in to sandbag endangered levees. Communications also was offered to the Salvation Army and National Guard, Willoughby said.

Hams who were trained by the Red Cross in damage assessment also were utilized in the Des Moines area. Two-person teams of hams would go into areas to start damage

assessment and would radio in hourly to their headquarters while in areas without phone service. Willoughby noted that at times there were not enough volunteers for shifts, which were scheduled 24 hours in advance.

"We're pleased we were able to do as good a job," he said, adding "We managed to meet our target levels at all times."

Charron noted that the hams involved in the flood situation also were able to serve in a rumor control function, offering information on roads and bridges that were closed to those who inquired on amateur frequencies.

Looking back at the services provided by the hams, Willoughby observed that more mobile Amateur Radio equipment with cigarette lighter plugs and magnetic-mount antennas could have been used during the disaster operation. The lighter plugs allow mobile ham gear to be operated from any vehicle so equipped, as do the mag-mount antennas.

Safety is an important aspect of providing communications support during an emergency, and unfortulately there was one non-amateur, communications-related death during the flood operation.

Spc. Steven M. West, 30, of Ogden, Iowa, died after an antenna he was attempting to erect fell over and came in contact with a high-voltage power line. West was setting up equipment at Veterans Auditorium in Des Moines for communications with Iowa Army National Guard water trucks, which provided potable water for the city's residents at various locations throughout the city.

While Des Moines and the rest of the Midwest started cleaning up from the flooding, the hams who ride along the Des Moines Register's Annual Great Bicycle Ride Across

Iowa (the RAGBRAI) prepared to be especially alert because of the weather problems.

The RAGBRAI, scheduled for late July, traverses the entire width of Iowa, where the thousands of riders start off on the western side of the state at the Missouri River and end on the eastern side by dipping their wheels into the Mississippi River.

Charron, who works in information services for the Register, coordinates the dozens of hams who ride along each year as "bicycle mobile." Charron expected 30 or so hams to ride along with the 7,000 other riders again this year, but he noted that they would be diverted if they were needed elsewhere.

"If any of our people are of use anywhere else (because of the flood clean-up) we would gladly go there," Charron said.

Chuck Gysi, 35, is news editor of The Hawk Eye in Burlington, Iowa. He is ARRL emergency coordinator for Des Moines County, Iowa, and an ARRL public information officer.

Kenwood calls FCC fines "baseless and unfair"

3 dealers hit for offering TS50S radios

The Kenwood Corporation has called FCC actions against three of its Amateur Radio dealers "baseless and unfair ... in violation of equal protection under the laws of the United States," and "severely damaging to Kenwood's commercial standing in a competitive industry."

Kenwood's complaint to the FCC is on behalf of three of its retail Amateur Radio dealers, each of whom received a Notice of Apparent Liability for $7,000.

The NALs, issued July 2, said that on March 5, 1993, the Los Angeles-area office of the FCC's Field Operations Bureau received a complaint alleging that the stores were marketing transceivers capable of operation outside of the amateur bands. The complaint said these transceivers "lacked the required Commission authorization."

FOB investigators went to the three stores, all in Southern California, where Kenwood TS-50S HF transceiver were displayed and where literature about the radios "indicated that the transceiver operated on frequencies not authorized for amateur radio use," a fact confirmed by store employees.

The NALs said "Transceivers capable of operating outside of the amateur radio band are required to have Commission authorization before marketing. The Kenwood TS-50S HF Transceiver lacked the required authorization. "The violation was willful," the NALs said.

The NALs were received by Henry Radio, Los Angeles; Jun's Electronics, Culver City, Calif.; and Ham Radio Outlet, Van Nuys, Calif.

Westlink Report reported in its March 18 issue (less than two weeks after the "complaint" to the FCC cited above) that "we hear rumors from the FCC that the agency is 'concerned' with some of the out-of-band capability of the new transceiver. ...the FCC is reportedly most concerned about the TS-50S's ability to put out 100 watts (25 watts AM) right into the CB band without any modification," *Westlink* said.

By this time Kenwood had retained a Washington, D.C. communications attorney, Chris Imlay, N3AKD. Imlay also is, incidentally, general counsel for the ARRL. Imlay asked the

chief of the FCC's Investigations and Inspections Branch, Enforcement Division, for a conference on the matter, saying that "On information and belief, this complaint may have been registered by a competitor of Kenwood, motivated by anti-competitive, rather than substantive concerns."

A few days after the NALs were issued in early July, Kenwood sent a news release to its dealers, saying "We have been aware of the FCC inquiry for some time, and our attorney was assured by the FCC that this type of action (NALs) would not be taken.

"Please be assured that we are doing everything legally possible to have this situation resolved as quickly as possible," Kenwood said.

On July 12 Imlay filed a response to the NALs, on behalf of the three Kenwood dealers, to the FCC's Cerritos, Calif. field office of the FOB, requesting that the notices be immediately rescinded.

Imlay said that the complaint that the radios were being marketed without being type-accepted was without merit, since "This characteristic is shared by virtually every commercially made amateur radio transceiver for the past 20 years."

Imlay also noted that the complaint seemed to be based in part on TS50S literature indicating that the radios can transmit outside the amateur bands. In fact, according to Kenwood, an initial shipment of brochures for the TS50S, printed overseas and distributed in small quantities to Kenwood dealers, *did* show frequency ranges greater than the amateur band limits (e.g., 1.705-2.0 MHz, 3.0-4.0 MHz, etc).

Kenwood responded that they did not ever advertise

to CB operators, and that the offending brochures were pulled and replaced when the error was discovered.

Imlay, in his filing, recounted his letter to the chief of Investigations and Inspections, as well as a follow-up telephone conversation in which he was told that "any action that would be taken in this case ... would be done on an industry-wide basis, and not by an individual enforcement proceeding."

"The Commission has known for years," Imlay wrote, "that amateur radio transceivers with the capability noted in the NALs were being marketed throughout the United States. Under these circumstances, the issuance of the three NALs makes no sense whatsoever, and the only effect is to single out Kenwood from among the manufacturers of other amateur radio transceivers over the past 20 years."

Imlay said "the Commission has not shown that the Kenwood TS50S transceiver requires type acceptance. It is an amateur radio transceiver, which, upon proof of license, is modifiable for MARS or CAP operation by Kenwood. It is not intended by Kenwood or the dealers for operation on frequencies allocated to other radio services, nor have the NALs alleged that it is.

"There is no indication that it has been marketed or sold to other than amateur radio operators, CAP or MARS operators. Imlay said. "It indeed has limited transmit capability outside amateur allocations, as do other Kenwood amateur radio transmitters and those of virtually all amateur radio equipment manufacturers, but that capability alone does not obligate Kenwood, or any other amateur radio equipment manufacturer or retailer to obtain type acceptance for amateur radio equipment under current rules."

Imlay told the FCC that if it thought that all amateur radio transmitters capable of transmitting "even one Hertz" outside of the ham bands should be type accepted, then that should be accomplished through a full notice and comment rule making procedure. "This is not necessary or desirable," he said, "but it would at least provide a fair hearing for the amateur radio industry.

"The NALs are not only baseless as a matter of law, they are a completely inappropriate response to an apparent Commission concern about the possibility of misuse of the products," Imlay said.

LEAGUE FILES REPLIES TO
219 MHZ, PROFILER PLANS

The League has filed reply comments in two FCC proposals, to allocate 219-220 MHz to amateurs on a shared basis (ET Docket 93-40) and to allocate 449 and/or 915 MHz to wind profiler radars (ET Docket 93-59).

In the matter of 219-220 MHz, the League noted that comments in the matter overwhelmingly supported the allocation for amateurs, restated the cooperation between the League and Waterway Communications System Inc. (which operates a maritime service in the 219-220 band), and cited comments by other amateur radio entities supporting the League's contention that the allocation is urgently needed to alleviate crowding in the 222-225 MHz amateur band in much of the country.

In its reply comments on proposed allocations for wind profiler radars the League said once again that the proposal was confusing, due to its dual nature, and that the League was still skeptical that wind profilers would be kept away from metropolitan areas (where they would have the

greatest interference potential).

More on these proposals will appear in September *QST*.

VEC'S PETITION TO FCC SEEKS "INSTANT OPERATING" RIGHTS

A petition by the Western Carolina Amateur Radio Society (WCARS) VEC of Knoxville, Tennessee, asks the FCC to change its rules to allow amateur privileges to people awaiting their first license (and call sign) from the Commission.

The petition has been assigned RM-8288 by the FCC.

WCARS asks that anyone who holds a valid Certificate of Successful Completion (CSCE) for an amateur operator license issued within the previous 365 days be authorized the rights and privileges of the applicable license class before their call sign is issued and received from the FCC.

The petition proposes a temporary call sign structure using the prefix WZ followed by numbers and letters determined from the CSCE-holder's name. WCARS cites a similar system having been used in the Citizens Radio Service as a precedent.

The petition says that the system by which upgraded privileges are immediately available to those already holding call signs has worked well, as well as noting that it now is possible to walk into a VE test session as an unlicensed person and walk out with an Amateur Extra Class CSCE (yet not be able to operate on the air for as much as two months).

Finally, the WCARS VEC says that instituting an "instant operating" rule would save the Commission time and money by eliminating telephone calls from "licensees in

waiting."

The WCARS-VEC aired their proposal at the National Conference of VECs in June.

The idea is not a new one. In 1987 the FCC denied a similar petition, by Frederick G. Hambrecht, KJ4JE, which sought "instant operating" privileges for Novice licensees using call signs based on those of the administering volunteer examiners.

15 comments were filed in response to the Hambrecht petition, 11 in support and four opposed. Those opposed said that the waiting period was useful in allowing the newcomers to put their stations together, and others opposed the proposal on the grounds that the call sign scheme would be confusing and unwieldy.

The FCC, in denying the Hambrecht petition, said that while application processing times had been long (on the order of two months) when the petition was made, it had been reduced to a matter of weeks and was therefore not excessive.

The FCC also said that "it appeared" that the International *Radio Regulations* to which the U.S. is a signatory would not allow an "instant operating" arrangement.

BOARD MEETING HIGHLIGHTS

The ARRL Board of Directors met in Windsor Locks, Connecticut, July 16-17. The following is a summary of the actions taken:

* The Board adopted the recommendations of its Digital Committee, and, accordingly, will seek from the FCC regulations to permit semiautomatic digital operation below 30 MHz on frequencies authorized for data emissions, outside

of the proposed new subbands for automatic operation.
Bandwidth of digital transmissions of such operations would be limited to 500 Hz, and transmissions would be permitted only in response to stations under active operator control. Digital operators will be cautioned to strictly adhere to IARU band plans for digital operation.
ARRL will develop, through its Digital Committee, operating guidelines for semiautomatic operation.

* The League will also petition the FCC to seek relief from regulatory restrictions on HF digital operations to further the amateur service's ability to contribute to the advancement of the radio art.
* The Board affirmed its commitment to have the League serve as the club and military recreation station call sign administrator on behalf of the FCC on an unconditional basis.
* The ARRL Friendship Award was created to encourage friendly contact between radio amateurs and the discovery of new friends through personal communication.
* The League will publish a DXCC Yearbook to be distributed to active DXCC participants who are League members at no charge.
* The League will petition the FCC to establish a lifetime operator license for the Amateur Radio Service.
* A new Amateur Auxiliary Training Manual was approved by the Board, subject to the receipt of an updated memorandum of understanding between the ARRL and the FCC.
* In response to a recommendation from its Industry Advisory Council, the Board stated its support for the concept of plug-to-plug compatibility between Amateur Radio equipment.

* The Board accepted DXAC-recommended DXpedition operating practices and urged their widest practical distribution.
* The Board committed League support for the FCC efforts to implement electronic filing of license and upgrade applications. The General Counsel was directed to file comments opposing any attempt by any authority, other than FCC, to provide a point-of-examination temporary operating authority.
* The Board endorsed the concept of an international Amateur Radio permit, similar in nature to the international driver's license. It urged that the foundation be laid for the submission of a proposal to create such a permit to a future ITU conference.
* A new Spectrum Management Committee was created to address changes brought about by new technology.
* The Board affirmed its policy of seeking expansion of the 20-meter band from 14.350 to 14.400 MHz.
* Chris Anziano, KD1OX, was selected as the recipient of the Hiram Percy Maxim Memorial Award for 1992. James McCauley, AB6EU, won the Excellence in Recruiting Award.
* The Philip J. McGan Silver Antenna Award was awarded to Gary Pearce, KN4AQ. The award recognizes excellence in public relations.
* The Board bestowed the Technical Excellence Award for 1992 upon Kenneth Macleish, W7TX, for his article, "Why an Antenna Radiates," which appeared in the November 1992 issue of QST.
* James Stafford, W4QO, was picked as the Herb S. Brier Instructor of the Year. Robert Maurais, KC1IV, won

honors as the Professional Teacher of the Year.

* The Headquarters staff was commended for its efforts in eliminating the DXCC backlog.

The full minutes of the meeting will appear in September *QST*.

BRIEFS

* ARRL Dakota Division Director Howard Mark, W0OZC, has resigned due to an impending move to another ARRL division. His resignation took effect July 18. Per the ARRL bylaws, Dakota Division Vice Director Rick Whiting, W0TN, assumes the office of director for the remainder of Mark's term, until January 1, 1994.

ARRL Southeastern Division Director Frank M. Butler Jr., W4RH, has been appointed by ARRL President George Wilson, W4OYI, to replace Mark on the ARRL Executive Committee for the remainder of Mark's term.

* Four New Orleans-area amateurs have received notices of violation from the FCC. Joseph F. Richard, N5INX (Amateur Extra Class); John B. Genovese, WB5LOC (Advanced class); Vernon A. Paroli, KA5OWW (Advanced class); and Will T. Blanton Jr., N5ROC (General class) all were cited for voilations of FCC Rule 97.101 (d) regarding malicious interference.

The alleged violations took place on 2-meter FM.

FCC Notices of violations require a reply to the Commission. They do not carry a monetary fine.

* Leonard F. Shaner Jr. of Pottstown, Pa., has received an FCC Notice of Apparent Liability for $2,000 for allegedly causing interference to a 2-meter repeater. Shaner is not an amateur licensee.

The Icom W2 series (a for you, e for me :-), have very poor battary contacts.
You might try to bend them out (gently!) and see if that improves;
I'm about to order a spare for my rig.

Actually, one type of shunt-trip breaker is readily available at
lumber yards and home improvement centres; try a GFI breaker. Your
"emergency power off buttons" would be big red buttons that would put
a 10K resistor from line to ground. Its a little "un-clean" but it
would be very simple and cheap; don't use it for daily shutdowns, though,
since consumer GFIs probably will only live for a couple of hundred
cycles in their lifetime.
The drawback may be that any REAL ham will want to run his kilowatt
moonbounce rig on 230 VAC; I've never seen a 2-pole GFI at a lumber
yard.
I had to supply "EPO" or "E-STOP" buttons for a computer room at
work some years ago; we later installed a second button so that if
the power tripped, a "start" button was required to restore power. This
derived from an incident in which a faulty emergency power system caused
a 600 volt breaker to cycle about 30 times; this was *extremely* hard
on the drives in the PDP 11. I just used a regular AC contactor,
though.

24. Earphone Phasing - an experiment

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-01 22:52:11 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <CB3rIz.5tJ@odin.corp.sgi.com>
Source record: 278548

Trevor, a G3 who says he is exiled in TX, asked me if i knew
about an old trick of changing the phasing on a set of earphones.
i didn't.

so he mentioned Bob Locher, W9KNI, and his book "The COMPLETE DX'er".
i bought one copy at texas towers and off i went to the home qth to
check it out. cost me two hours, since i started reading it and
couldn't put it down. found it interesting and entertaining. more
insight about DXers in general.

anyway, about chapter 21 he says: (about headphones, head clamps, or
whatever you call them...)

"...are normally wired in phase, so that the apparant source of signals
heard is outside of the head, and of course it is. But, reversing the
phase of the headphones will make the apparent source of the signals
seem to come from the middle of your head. This change, though subtle,
is rather advantageous for copying CW in QRM and QRN, expecially in
weak signal conditions." and he goes on in detail how to do this.

so off to the shack and i have two pairs of Yaesu YH-77 earphones that
i have had a while and really like. off with the plug to one and sure
enough. there are two sets of cables, one for each ear. i get the
alligator test clips out and fire up the TenTec Argosy II.

i disagree with Bob, W9KNI, on the in phase source. i think that i
still preceive the sound to come from inside the head, but had never
paid any attention to it before while op'ing, but since i was doing this little
experiment, i was focused. after the next step and coming back to in
phase, i preceive the sound centrally located and a point source with
the left and right ear wired in phase.

when reversing the wiring to one ear to get the left outta phase with
the right by 180 degrees, the sound source "broadens", i.e. it seems
to be coming from the left and the right. i find it to be an interesting
effect. in phase may be the reason some people get headaches copying morse
with phones (i've heard of this). phasing is rather calming. the headaches
may also be caused (as i'm sure we're gonna hear the flames on this one,
flame suit on) by increased tension and concentration (a rare trait in
some individuals) brought on by using CW..... :-) ;-) (humour suit on).....

i have permanently wired the earphones with the 180 degree phasing built
in. query me once in a while to see if i'm still doing ok..... ;-)

seems to work great for both 599 (REAL 599) and 439 signals on CW.
my hands start to shake when i get above 60KHz from the low end of the
amateur bands. someone else on the net will have to relate their

experiences on the other modes on the high ends of the bands. :-)

i did listen to WWV on 10MHz and i can tell the difference between the two sets of phones and i prefer the 180 degree phasing. thanks to Trevor for bringing this up and thanks to Bob Locher for writing about it.

the human mind and the ears make up a beautiful comination. we tell the direction of sound by the relative strength between the right and left ear. with mono on earphones, the sound intensity is the same in each ear. evidently, with phasing, we have the ability to discern a change in phase also. see my previous post on the small earphone and the null effect, a.k.a the Adams Effect.

FYI de k5fo dit dit

Hi David,

The two dits at the end of a QSO (SK e e) is a little flourish, just for fun, to tie the ribbons on an enjoyable QSO.

Just a couple of cents here...

Until such time as the "armchair lawyers" get the AUTHORITY to issue Notices of Apparent Liability or make the judgements, I'm not going to worry too much about them. The last time I read 97.113 it was more vague about what was allowed than what was prohibited and I expect the new verbage to be even better. So far have only seen the ARRL bulletin regarding the forthcoming change.

SB SAT @ AMSAT $ANS-213.01
TWO-METER TRANSMITTER FOR PHASE 3D

HR AMSAT NEWS SERVICE BULLETIN 213.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 1, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-213.01
2m Transmitter Announcement
AMSAT-UK MEMBER TO BUILD 2M TRANSMITTER FOR PHASE 3D

In a joint statement issued at the recently completed AMSAT-UK Colloquium, Ron Broadbent, G3AAJ, Honorary Secretary of AMSAT-UK, and Ray Soifer, W2RS, Executive Vice President of AMSAT-NA, announced that a 2-meter downlink transmitter for the Phase 3D satellite is to be designed and built by Mike Dorsett, G6GEJ, as part of the international Phase 3D project team. Mike, who met with project leaders including Karl Meinzer, DJ4ZC, and Dick Jansson, WD4FAB, last week in Marburg, Germany, to discuss technical details, described his proposed design at the Colloquium, held at the University of Surrey on July 29 to August 1, 1993.

Together with the 70cm uplink receiver already planned, this means that there will, indeed, be a Mode UV capability (formerly known as Mode B) on the new satellite. If all goes as expected, users of Mode B on AO-13 can look forward to improved performance from Phase 3D.
As soon as the need for a qualified builder became known some months ago, AMSAT-UK and AMSAT-NA worked closely together to identify and screen prospective candidates. Mike Dorsett, G6GEJ, is a well-known designer of high performance VHF/UHF equipment. He is a longtime member of AMSAT-UK and is doing this work strictly on a volunteer basis. Mike's strong technical background will be a welcome addition to the international Phase 3D project team.

Here's a question for fellow CW fans on the question of etiquette;

You have just finished a QSO with a station in (say) Germany. You answered his CQ; so it's nominally "his" frequency. At exchange of SK, another station now calls you. As far as you can hear, the other station has received no other calls. Is it ok for you now to reply to the caller, or should I QSY to a nearby clear spot and call? That is, does the frequency come "up-for-grabs" at exchange of SK?

If the station I have just finished with is a rare one, then naturally I leave the frequency for him/her. But quite often, when finishing with a regular station, one or two stations will call me- but the other operator was there first. Common sense usually sorts it out. Is there a convention?

73, Drew, VK3XU.

>>$490. Useless unless you have a fichereader, or are blind.

What is the deal with this? As I recall, this was quite a bit cheaper
when it first became available - then it went up drastically in price
to the current $490 (which eliminated me as a potential customer).

What would be really nice would be to get the last 10-20 years or so
on fiche for a reasonable price - the paper versions would most likely
hit the round file at that point.

Actually, I'd be interested in seeing how to resolve this problem in an
easy way. I know, I know.. .ground the equipmnet but what do you do with
a computer monitor that has virtually NO metal in it?

I've noticed VGA monitors tend to completely trash 20m and my XT tends
to trash certain parts of 2m when it's doing intensive disk i/o.

Grrrrr.... conflicting technologies!

32. Radio Ship II

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 03:55:01 UTC
From: bigsteve@dorsai.dorsai.org
Message-ID: <23i36l$6uc@dorsai.dorsai.org>
Source record: 278556

A few weeks ago we posted the "official" story of the Radio Ship currently under construction. All the information, as inconsistent as it sounded, came from Scott Becker, the owner of the ship. Even though I suspected he was building a smoke screen to cover up the true stories that were leaking out as "rumors", I published it anyway.

Of course, anyone who has read the Pirate Radio topic on the Genie Radio Round Table, or who has spoken to the management of WWCR, knows that I knew I was being used, but I had no proof that he was lying. I will now list Mr. Becker's story, as we aired it on the Spectrum program, and as countered by the proof we have since discovered that he was again fabricating disinformation.

Mr. Becker denied that the ship was in Boston in the first interview. The next week, however, I had him and Johnny Lighting on my Crossband program. During the second interview he admitted that the ship was in East Boston and that if you called him first, he would tell you where to come and see it. He said you could not get on board due to insurance restrictions.

In the first interview, he would not disclose the name of the ship, the radio station or the name of his company. During the second, John disclosed the name of the station as Voyager Broadcasting International a division of Voyager Broadcasting Services. The name of the company and the actual location were broadcast as a news item my me on that weekend's Spectrum.

With the mention of East Boston, my Spectrum teammate, WBZ's Scott Fybush's ears went up. After a few telephone calls between us, where I gave him Alan Weiners number along with all the other information and speculation I had, he set out on finding the ship. He found it in one of the worst sections of the harbor and got permission to go on board, something Becker said you could not get.

Scott went onboard last week and got an interview with the ship's Captain and First Officer. His report was aired on Spectrum this past Saturday night. Scott Becker specifically denied that name was the "FURY" in his first interview with me. Scott Fybush's first discovery was that the name was the "FURY V". In the course of the interview, Fybush found out the destination of the ship would be the Caribbean, exactly what the rumors said. Becker said it would be the Mediterranean.

One thing that Becker had said in the first interview was that this deal with the Caribbean country was, "a done deal, signed sealed and delivered". In the second interview he alluded to the fact that he didn't want the name of the country to get out because pressure from the US government might get

them to back out. But if it was a done deal, why was he leaving the country that Friday? What Scott Fybush found out was that Becker was trying to get the license finalized by the country, St. Kitts & Nevis, the same country Becker had denied in the first interview was the country of registry.

Ok everybody, believe everything you hear about the ship if it DOESN'T come from a Scott Becker press release or interview. In the course of the investigation we were doing we contacted Bill Dugan, the pirate broadcaster from Phoenix who is currently fighting the FCC for the creation of a class of community radio broadcast license. Dugan had been contacted by Becker, he wanted him to work for him. If Dugan had been contacted, how many others were? And how much true info came from Becker as selling points to those people?

How much interest does Brother R.G. Stair in the venture? He's the cash source for Scott Becker, but does that mean he knows all? Does he know what Scott really thinks about him? An attitude he spilled out in my Crossband interview. Well, look for IT to hit the fan. I found out that WWCR was recording the Crossband interview, they told the good Brother about it. Bro. Stair asked them to send him a copy.

==========

Spectrum is heard on WWCR shortwave, 7435 Khz., on Saturday nights at 11:35PM eastern time/0335 UTC, Sunday. It is also heard simultaneously on the Let's Talk Radio Network, see signature below.

33. 11 Meter equipment ban on local swap net

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 04:00:36 UTC
From: pachner@csd4.csd.uwm.edu
Message-ID: <23i3h4INNflk@uwm.edu>
Source record: 278555

On the local Milwaukee Swap net, they have pretty much banned any 11 meter equipment type traffic. It's a swap net, so why not let us swap anything we want? (I don't believe it's the clubs decision to ban this, rather the net controller)

ZCZC AG15
QST DE W1AW
ARRL BULLETIN 73 ARLB073
FROM ARRL HEADQUARTERS
NEWINGTON CT JULY 9, 1993
TO ALL RADIO AMATEURS

SB QST ARL ARLB073
ARLB073 449 MHZ PLAN OPPOSED

449 MHZ PLAN OPPOSED

THE LEAGUE HAS TOLD THE FCC THAT A PROPOSAL TO ALLOCATE THE
FREQUENCY 449 MHZ FOR WIND PROFILER RADAR SYSTEMS SHOULD BE BASED
ONLY ON CAREFUL COORDINATION PROCESSES AND SITE SELECTION, TO AVOID
INTERFERENCE TO AMATEURS, WHO SHARE ON A SECONDARY BASIS THE BAND
420-450 MHZ WITH GOVERNMENT (MILITARY) RADIOLOCATION OPERATIONS.

IN APRIL THE FCC ISSUED AN NOTICE OF PROPOSED RULE MAKING (IN ET
DOCKET 93-59) TO MAKE THE ALLOCATION, AND ASKED FOR COMMENTS ON
WHETHER WIND PROFILERS SHOULD ALSO BE ACCOMMODATED IN THE 915 MHZ
BAND OR ELSEWHERE.

THE LEAGUE TOLD THE FCC THAT THE 420-450 MHZ BAND IS HEAVILY USED BY
THE
AMATEUR RADIO SERVICE, ESPECIALLY FOR FM REPEATERS, IT BEING THE
SECOND MOST POPULAR VHF/UHF AMATEUR ALLOCATION, WITH MORE THAN 5,000
REPEATERS.

THESE REPEATERS ARE USED FOR PUBLIC SERVICE COMMUNICATIONS,
ESPECIALLY IN METROPOLITAN AREAS, AND ARE IMPORTANT IN THE
CONNECTION BETWEEN AMATEUR RADIO AND THE GOVERNMENT'S SKYWARN SEVERE
WEATHER WARNING SYSTEM, THE LEAGUE SAID.

THE LEAGUE SAID THAT IT APPEARS POSSIBLE THAT GOVERNMENT WIND
PROFILERS COULD BE USED IN THIS BAND WITHOUT DISRUPTING EXISTING
AMATEUR OPERATIONS,_BUT ONLY WITH PROPER COORDINATION, AND THAT
NON-GOVERNMENT PROFILERS COULD PRESENT EVEN MORE SERIOUS
INTERFERENCE POSSIBILITIES. MORE INFORMATION IS IN QST FOR MAY
1993, PAGE 88.

FROM ARRL HEADQUARTERS
NEWINGTON CT JULY 9, 1993
TO ALL RADIO AMATEURS

SB QST ARL ARLB074
ARLB074 MESSAGE CONTENT PROPOSAL

MESSAGE CONTENT PROPOSAL

THE ARRL HAD FILED COMMENTS WITH THE FCC ON THEIR PROPOSAL TO DEFINE
THE RESPONSIBILITY FOR THE CONTENT OF AMATEUR MESSAGES RELAYED BY
HIGH-SPEED NETWORKS.

THE FCC'S PROPOSAL, IN PR DOCKET 93-85, WAS IN RESPONSE TO A NUMBER
OF PETITIONS FOR RULE MAKING, AND WOULD ESTABLISH ''A COMPLIANCE
POLICY FOR AMATEUR STATIONS PARTICIPATING IN AUTOMATIC MESSAGE
FORWARING SYSTEMS, TO HOLD THE LICENSEE OF THE STATION ORIGINATING
A MESSAGE AND THE LICENSEE OF THE FIRST FORWARDING STATION PRIMARILY_
ACCOUNTABLE FOR VIOLATIVE COMMUNICATIONS.''

THE PETITIONS WERE FILED FOLLOWING AN INCIDENT IN EARLY 1991, WHEN
THE OPERATORS OF SEVERAL AMATEUR PACKET BULLETIN BOARDS WERE CITED
BY THE COMMISSION FOR FORWARDING WHAT WAS CHARACTERIZED AS A
''COMMERCIAL'' MESSAGE.

THE PROPOSAL WOULD MODIFY CURRENT FCC RULES, WHICH PROVIDE
ACCOUNTABILITY OF EACH LICENSEE FOR EVERY TRANSMISSION FROM THE
LICENSEE'S STATION, REGARDLESS OF THE CONFIGURATION OF THE SYSTEM OF
STATIONS IN A DATA NETWORK OR WHETHER THE STATION IS IN REPEATER
OPERATION.

THE LEAGUE SUGGESTED THAT SOME FINE TUNING OF THE DEFINITIONS OF THE
TERMS ''ORIGINATOR'' AND ''FIRST FORWARDER'' WAS NEEDED.

MORE INFORMATION IS IN QST FOR MAY 1993, PAGE 88.

ARRL director resigns

ARRL Dakota Division Director Howard Mark, W0OZC, has resigned due
to an impending move to another ARRL dvision. His resignation took
effect July 18. Per the ARRL bylaws, Dakota Division Vice Director
Rick Whiting, W0TN, assumes the office of director for the remainder
of Mark's term, until January 1, 1994. ARRL Southeastern Division
Director Frank M. Butler Jr., W4RH, has been appointed by ARRL
President George Wilson, W4OYI, to replace Mark on the ARRL
Executive Committee for the remainder of Mark's term.

I've taken my radio as carry-on many times (Detroit Metro & Chicago O'Hare)
and had no problems.
It went through the X-Rays and nothing was said.

> Also, can you transmit from within an airline terminal, or is there a
> chance that you will be causing harmful interference to anyone? Also,

>

I have also used my HT in a terminal (not for long though, the person I was
calling didn't answer) and while I was wondering the same thing, I wasn't
harrassed by anyone...

Hope this helps!

43. 1.5 KW Generator for Sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 11:19:00 UTC
From: robert.garcia@sosinc.com
Message-ID: <1781.556.uupcb@sosinc.com>
Source record: 278521

1.5 KW Gasoline Powered 16 to 36 volt DC Generator for sale

I have several military surplus cage mounted DC generators that have
been refurbished and are offered for sale. The units have a manually
variable voltage output of about 16 to 36 volts at up to 57 Amps
continuous (approximately 100 Amps intermediate) operation. These
generators were originally designed to power military radio transmitters
under extreme conditions or "jump start" large diesel engines in trucks
and tanks.
The generators are powered by a heavy duty two (2) cylinder air
cooled industrial (Wisconsin) engine of 16 cubic inches and produce about
10 horsepower using ANY type of gasoline. The engines have a protected
ignition system designed to start and run under the worst weather
conditions. The engines are quite capable of powering a standard 5 KW
120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come
equipped with a mechanical fuel pump allowing gasoline to be drawn from
the integral 1.5 gallon tank or an auxiliary fuel tank. Repair parts are
available at any auto supply outlet or outboard motor supply business.
These generators were designed to be "GI proof" and have been maintained
and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
The engines have been used on large "mudboats" in Louisiana marshes.

Original cost to the US Government: $2610.00

Sale Price: $300 each FOB Baton Rouge, LA.

Weight: 121 pounds each

Another useful trick is to put a filter in series with each earpiece: one is a high-pass type filter and the other is a low-pass type. This spreads the audio spectrum round inside your head (?) and allows you to concentrate on a particular signal more easily.

However, it does take more bits than simply phasing the earpieces :-)

45. Radio Ship II

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 11:56:35 UTC
From: bigsteve@dorsai.dorsai.org
Message-ID: <23ivdj$17l@dorsai.dorsai.org>
Source record: 278570

A few weeks ago we posted the "official" story of the Radio Ship currently under construction. All the information, as inconsistent as it sounded, came from Scott Becker, the owner of the ship. Even though I suspected he was building a smoke screen to cover up the true stories that were leaking out as "rumors", I published it anyway.

Of course, anyone who has read the Pirate Radio topic on the Genie Radio Round Table, or who has spoken to the management of WWCR, knows that I knew I was being used, but I had no proof that he was lying. I will now list Mr. Becker's story, as we aired it on the Spectrum program, and as countered by the proof we have since discovered that he was again fabricating disinformation.

Mr. Becker denied that the ship was in Boston in the first interview. The next week, however, I had him and Johnny Lighting on my Crossband program. During the second interview he admitted that the ship was in East Boston and that if you called him first, he would tell you where to come and see it. He said you could not get on board due to insurance restrictions.

In the first interview, he would not disclose the name of the ship, the radio station or the name of his company. During the second, John disclosed the name of the station as Voyager Broadcasting International a division of Voyager Broadcasting Services. The name of the company and the actual location were broadcast as a news item my me on that weekend's Spectrum.

With the mention of East Boston, my Spectrum teammate, WBZ's Scott Fybush's ears went up. After a few telephone calls between us, where I gave him Alan Weiners number along with all the other information and speculation I had, he set out on finding the ship. He found it in one of the worst sections of the harbor and got permission to go on board, something Becker said you could not get.

Scott went onboard last week and got an interview with the ship's Captain and First Officer. His report was aired on Spectrum this past Saturday night. Scott Becker specifically denied that name was the "FURY" in his first interview with me. Scott Fybush's first discovery was that the name was the "FURY V". In the course of the interview, Fybush found out the destination of the ship would be the Caribbean, exactly what the rumors said. Becker said it would be the Mediterranean.

One thing that Becker had said in the first interview was that this deal with the Caribbean country was, "a done deal, signed sealed and delivered". In the second interview he alluded to the fact that he didn't want the name of the country to get out because pressure from the US government might get

them to back out. But if it was a done deal, why was he leaving the country that Friday? What Scott Fybush found out was that Becker was trying to get the license finalized by the country, St. Kitts & Nevis, the same country Becker had denied in the first interview was the country of registry.

Ok everybody, believe everything you hear about the ship if it DOESN'T come from a Scott Becker press release or interview. In the course of the investigation we were doing we contacted Bill Dugan, the pirate broadcaster from Phoenix who is currently fighting the FCC for the creation of a class of community radio broadcast license. Dugan had been contacted by Becker, he wanted him to work for him. If Dugan had been contacted, how many others were? And how much true info came from Becker as selling points to those people?

How much interest does Brother R.G. Stair in the venture? He's the cash source for Scott Becker, but does that mean he knows all? Does he know what Scott really thinks about him? An attitude he spilled out in my Crossband interview. Well, look for IT to hit the fan. I found out that WWCR was recording the Crossband interview, they told the good Brother about it. Bro. Stair asked them to send him a copy.

==========

Spectrum is heard on WWCR shortwave, 7435 Khz., on Saturday nights at 11:35PM eastern time/0335 UTC, Sunday. It is also heard simultaneously on the Let's Talk Radio Network, see signature below.

>On the local Milwaukee Swap net, they have pretty much banned any 11 meter
>equipment type traffic. It's a swap net, so why not let us swap anything we
>want? (I don't believe it's the clubs decision to ban this, rather the net
>controller)

The FCC regs don't allow hams to advertise stuff over the air unless the
equipment is either ham gear or is equipment (like computers) that can be
used in day-to-day shack operations. That pretty much zaps most CB gear,
unless it is modified to work in amateur bands.

CB linears, however, can be easily modified for 12/10 meter use and should
be OK. Talk to your net controller (off-air) and see what he thinks. (The
subject of *why* someone has a CB linear is best discussed in alt.flame. :-)

47. 87.5 MHz signal in France

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 13:39:32 UTC
From: jhb@dcs.ed.ac.uk
Message-ID: <CB4wLw.AnH@dcs.ed.ac.uk>
Source record: 278574
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur

Has anyone any idea what the tones permanently resident on 87.5 MHz throughout France are? At 87.5MHz FM there is a constant tone about 1 KHz which every so often gives a short cadence then resumes. It is not a single station marker as I was getting it all up the French west coast and it sounds a bit complex for that. Some data or time signal transmission?

> to damage an SMD-resistor or even the 5V regulator with that.

While it's likely that nothing will be harmed, do note that most SMD
resistors are rated for 1/8th watt dissipation, not 1/4 watt. So you'll
be pulling twice the rated power through the resistor. Because of the
heatsinking effect of the circuit board, and because of the intermittant
nature of the short, the resistor probably won't be harmed. Now the short
is going to add 50 milliamps to the regulator's load. Assuming that a
78L05, or equivalent, is being used, that's half it's rated output. So
you may be exceeding it's ratings due to the other loads it's powering.
Finally, 50 mils is 50 mils you really don't want to be draining from
the battery if you want long service from a charge. The proper plug
isn't that expensive, use it.

Gary

The difference between these tubes is that the 4x250 has a glass base seal
and the 4cx250 has a ceramic seal. The 4cx250 is preferable since the seal
is more rugged, but for amateur use these tubes are essentially
interchangeable. I have had 4x250's which made better than 300 W out on
two meters for quite a while. The 4-250 is an entirely different tube and
is a large glass bottle with a different base.

: should not only give you the prosigns, but also a brief history of how it
: became what it did.

I must have missed the note where you said before.

--
I did look in the Handbook. It gives a list but not how to use them. Is SK
the only one you think doesn't belongs at the end or are there others? Which
ham book said SK doesn't go at the end? Do you send the other stations call
when doing a SK? If so how (N0RDV SK de K0GU or SK N0RDV de K0GU)?

--
I must confess I never actually use SK. I typically end a QSO with
N0RDV de K0GU . . with the 'de' being optional. The SK is implied in the
dit dit. This obviously won't be technically correct but is a popular
current style.

I am probably now expert on this phasing thing and headphones, but here is my 20/1000 of a dollar bill.

There is an article in one of the first few "Communications Quarterly" mags about the phasing idea. It used some kind of stereo gear (also not familiar with this stuff either). The phase was not 180 degrees, but some other adjustable amount (fancy stereo gear again).

Yup - it's been cut from two months down to 8 weeks! I have been watching
the time it takes and the overwhelming majority is 8-9 weeks with some
taking 12 weeks. They - of course - are refering to the time the FCC
munches on it, but they should be considering the average time of test to
receipt of license...

>and can be installed wherever there's a socket.

Well we have a saying around our plant about the difference between
Earth and Ground, "It's about 5 %#&*ing volts!" :-)

Our 110 volt residential wiring consists of three insulated wires, the
hot (black), the neutral (white), and the safety ground (green). The
safety ground *can* be bare under certain conditions, but the other
two are insulated. The safety ground and the neutral lead must be
connected together at the distribution panel, where they're both
connected to Earth ground, but they aren't supposed to be connected
together anywhere else. The voltage drop caused by current flow
in the neutral lead may allow it to be several volts above ground at
an outlet. Ground must be ground, so it normally is wired so that no
current flows through it that can cause a potential difference by
ohmic loss. A GFI is configured to measure current flow in this
third wire. If it exceeds a minimum value, it trips the hot lead
out of circuit. This is all fine and dandy unless someone has made
a wiring error and swapped hot and neutral. In that case, you can
still be dead meat.

Our 220 volt systems can be more complex. They can be either single
phase, or one of two different varieties of three phase. In residential
wiring single phase is normally used and all three wires usually carry
current. Two of the wires are "hot" and one is neutral. From either hot
wire to neutral, you get 110 volts. From one hot wire to the other, you
get 220 volts. Note the absence of a separate safety lead. Since GFIs
normally sense current flow in the safety lead, this becomes a problem
for GFI protection. The NEC says that most permanent 220 volt wiring
must run in armored conduit or cable. If that's *metallic* armor, and

if it's installed correctly, it can supply the safety ground connection. But the Code also allows non-metallic armor, and much of new construction uses this. This can leave you with no reliable safety ground in the system. Note that the neutral is required to be connected to Earth ground at the service panel, but as with the case for 110 volt wiring, there can still be a voltage drop along the neutral which will raise the neutral connection at an outlet above ground.

Ideally, loads are balanced so no *net* current flows in the neutral lead, thus it can be considered "ground", but this rarely happens in practice. It's possible for the neutral lead to be called upon to carry twice the current in either of the hot leads. (Loads with bad power factor) Now consider the case where such a circuit is connected to amateur equipment that also has a good Earth ground connection. If you bond neutral to the chassis, you've now created an alternative path to ground for currents on the neutral. Depending on the distribution of loads on the circuit, this can create a confusing, and potentially dangerous situation. So it's best to run separate 220 volt lines to equipment that may be Earth grounded.

The most reliable emergency disconnect is a large DP, or 3P, knife switch rated for the service, and contained in an Earth grounded metallic switchbox in a highly prominent location near the door. Second would be a motor driven disconnect. Third would be a relay contactor, and last would be to depend on a breaker. The remote disconnects and contactors are less satisfactory due to the possibility of contact welding disabling their function with no positive feedback to assure that service has truly been disconnected. Breakers are not normally designed to be used as switches, aircraft styles excepted, and may fail prematurely if pressed into this service. In all cases, I'd install a prominent red light, or set of red lights in the case of 220 volt circuits, to indicate when the circuit is "live".

55. 440 band opening Sunday night?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 14:28:06 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1993Aug2.142806.12955@VFL.Paramax.COM>
Source record: 278479

Did anyone else observe the unusual 440 MHz band opening Sunday evening - around 9 - 9:30 PM EDT Aug 1? I heard several W4 stations from Florida coming through on a few of our local 440 repeaters. Unfortunately I was not in a position to work any of them and only was able to write down one or two callsigns heard.

I have seen some 440 band openings before but from Pennsylvania to Florida!! (?) That is certainly not your typical band opening! I checked UHF TV about an hour later but saw nothing unusual.

>outer covering instead of black. It has N-type connectors attached.
>I can't seem to find a cable #1478 in any of my cable catalogs.

I can't find 1478 in my Belden Cat, but our University club bought a very large reel of Ethernet cable from surplus property for a song. I called the manufacturer about attenuation at 500 MHz and was told about 4 dB per 100 feet. We got a reel of yellow, RG-8 looking stuff with a solid center conductor that works quite well on our 2m repeater.

If it's cheap (the 1478), get it while it lasts.

The GFI trip button idea is brilliant! I'm going to install it. I suspect you'd have to make it a plug-in device to meet code, since it wouldn't be certified for direct connection. I don't see that as a problem.

Yes, indeed, cycling the power on any device with motors in it is likely to accelerate its wear.

In the late 70's I was working in England during an 'industrial action' by the electricity workers. There were scheduled power outages as part of this "strike". Each outage, which lasted from 15 minutes to several hours, was preceded by flashing the power off and on a few times, presumably to distinguish it from a common outage.

After the second such incident, I wired up a thermal delay relay and a large contactor with hold contacts and plugged the computer system into that. Thus it required power to be on constantly for about 10 minutes before it would power up the system, and would drop it solidly on the first flash.

>Actually, I'd be interested in seeing how to resolve this problem in an
>easy way. I know, I know.. .ground the equipmnet but what do you do with
>a computer monitor that has virtually NO metal in it?

I've posted on this subject before, but it bears repeating. The monitor *is* usually the prime culprit, and many monitors today are in plastic cases. There is a solution. GC, and others, sell conductive EMI sprays for plastic enclosures. Some of these sprays contain copper, most carbon, and some nickel. Nickel is best for our use since it can dissipate RF fields and offer some magnetic field suppression. The spraying is usually done on the inside of the case for esthetic reasons. Care must be taken that no overspray gets on electronic components, so total disassembly is usually required. Also, if HV components will be near the case when assembled, fish paper or other insulator should be glued to the case in that spot to prevent accidental discharges. Contact with the sprayed portion of the cabinet should be established by spring stock which is connected to station ground.

This is usually sufficient to quiet a monitor. What about the CRT face, you ask? Well, in color CRTs, the metallic shadow mask inside the tube does a good job of shielding the tube face. In mono CRTs, you may want to use fine screen wire mesh over the face, bonded to the station ground connection. This doubles as a glare filter, so you may decide to use it with color CRTs as well.

Of course all exterior cabling should be shielded, and in some cases you may wish to wind the cable through toroids as well. Don't try to use inline chokes or bypass caps on monitor leads. This will degrade the video signal and lead to smeared characters on the display.

On the PC itself, similar techniques can be used on plastic components of the machine. Normally PC cabinets are metal, but they are bonded poorly at joins. You should sand away any paint where sections of the cabinet join so as to achieve good RF connections. It's also good practice to emulate VHF/UHF equipment practices and install a screw at least every two

inches along a join. The floppy drive bay presents the hardest problem since you require external access to the drive face. One way to deal with this is to throughly shield the entire drive bay on the inside. This will stop RF leakage except when the drive is in actual operation. Using EMI spray on the faceplate is also helpful. Once again, shielded external cabling is the order of the day.

TNCs require similar treatment. The MFJ series cleans up best after application of sandpaper and some extra screws. This works for the PK-232 too. The TNCs that are in cast or molded cases are often harder to suppress. Usually the end plates on the cast cases don't make good electrical contact. On the plastic cased units, the EMI spray is helpful.

The hardest part of the system to shield is often the keyboard. There's no practical way to shield the keycap area. You may have to resort to internal modifications to the scanning circuitry, and a tin shield directly over the keyboard encoder or microprocessor. You can add small chokes or bypass caps on the scan drive leads without degrading the keyboard response. What you want is to "soften" the edges of the scan pulses so they don't resemble the output of a marker generator. Don't go overboard here or operation may be impaired.

|>
|> Hi David,
|>
|> The two dits at the end of a QSO (SK e e) is a little flourish, just for
|> fun, to tie the ribbons on an enjoyable QSO.
|>
|> 73 Drew, VK3XU.

Thanks, Drew. The "little flourish" is fun, I agree. But I don't think it's just that, or that {SK} is part of it.

1. {SK} clearly means "end of contact." The book says so. More to the point, that's how it's used. Other stations may now call without interrupting anything. So it's more important than a mere flourish.

2. There's a custom, which I have only heard carried out in full on the Novice bands, to sign like this: {SK} KA2CEI DE KA2DEF ESE EE. Or at least that's what it sounds like. It's really Roger Rabbit's favourite rhythm: "Shave and a haircut - two bits!"

(Lore: I saw on TV once a Vietnam vet and former POW who said prisoners there used this tapping sound to identify actual Americans behind prison walls, and then would use a tapping code to communicate. Apparantly the Vietnamese didn't know the rhythm, but the fellow interviewed claimed

they just couldn't master it, it was too foreign to their culture. I'm not sure I believe this last, but I very clearly remember him saying it.)

After a while, exchanging the entire rhythm becomes too long and almost trite. So ops who have been around awhile learn to drop the first part and send "dit dit" after signing. When both ops in an QSO have signed, they exchange "dit dit," and there's a method to this madness - those dits, while a flourish, also say "I got your last transmission, and I'm telling you that, even though I've already signed, and without sending this long sentence in code and having to sign again." In other words, both ops now know that the other one didn't disappear into the noise or explode or something. Very useful, and this satisfying feeling of a complete QSO is what you aptly call "tying the ribbons."

3. That's fun and utilitarian, but {SK} can't be a part of it, can it? "Proper" usage dictates that {SK} be sent *before* the callsigns, and I believe the previous poster who said that it meant "30" in American Morse, meaning "End, I have no more for you." If it's in the middle it can't be part of a flourish at the end.

4. My question was not what does {SK} mean, or whence did it come, but why you can't "correctly" put it after the callsigns without the A-1 Operator Police sending you a breach-of-practice card. I don't know. Judging from where you implititly placed it in you post, you don't know. AND NO ONE ON USENET KNOWS EITHER, because no one answered the question. No one cares, and the difference it makes is, apparently, Zero.

I submit that's because any original reason is no longer applicable and now long forgotten.

|> I was getting it all up the French west coast and it sounds a bit complex for
|> that. Some data or time signal transmission?

As far as I am informed this signal is present in Germnay, too and is
just a sort of beacon that marks the lower edge of the FM Broadcast
Band in Europe (88 MHz to 108 MHz).
I was told that this was set up to simplify the adjusting of the
tuning capacitor's left edge when fine tuning the device in the
factory.

The LF tone makes this 'cadence' to be not mistaken with some noise
signal that might be in the vicinity. If you tune a simple FM
broadcast receiver in Germany to the left edge, you very often hear
that sound.

If anybody knows more (or better), please followup!

>in space. It would make picking out the signal a lot easier, I suspect.

The high-end transceivers, like Yaesu's FT-1000 which I use, have
dual receivers. The FT-1000 has a mode where each rx feeds one
side of a pair of headphones. It is really interesting to use with
a CW DX station working split. You tune the primary rx to the
DX station, and the secondary rx to the pile up frequency. There
is a very noticeable psuedo-sterio effect, with the dx station
on one side of the room, and everybody (except the guy who forgot
what split means) else on the other. It is very much easier to
keep track of what is going on in the sterio mode than if one
switches to mono.

You can also tune both rx to the same freq, and use different
antennas. This produces effects best described as 'interesting'
rather than 'useful'. It seems the human aural system doesn't
make a very good voting reciever (selecting the less noisy signal.)

One of the mags (CQ?) a while back had a freq -> phase shift
circuit for doing exactly what you contemplate above - making
slightly different frequencys (again cw) have a different apparent
spatial location. Always wanted to built it; never did.

... Stuff deleted ....

This is a common problem, but it can be delt with with some time, energy, ferrite material, copper tape....

I wrote a chapter for the new ARRL RFI book... If you can get this book you should. There is alot of information on how to reduce noise to/from all types of sources (power lines, phones, computers, etc.)

This book will help you reduce the noise to your radios!

Got the good call, Scott, but not a copy of the FCC rule book? Doesn't
seem fair....

Subpart A - General Provisions:
Part 97.3.Definitiions.a: (10) Broadcasting. Transmissions intended for
reception by the general public, either direct or relayed.

Subpart B: Part 97.111.Autorized transmission.b goes on to list authorized
"one-way" transmissions (not broadcasting by definition) and includes
(5) Transmissions necessary to assist persons learning, or improving
proficiency in, the international Morse code;
(6) Transmissions necessary to dissemenated information bulletins; ...

Subpart C - Special Operations, 972.203, explictily provides for beacon
operation.

Anyway, the FCC is pretty specific (unless they're being purposely obscure!)
about what we can and can not do. Anyway, broadcasting _as defined_ is
illegal. There are plenty of one-way moded that are not, including all
kinds of fun things like remote control, telecommand, telemetry...

Singed, Much to late to get a good call...

Subject: FT-5100 fan turn on temperature
To: info-hams@ucsd.edu

I have the service manual for the FT-5100. There doesn't seem to
be any trimmer pot that can be set to change the fan's trip point.
In fact, the wiring diagrams don't seem to even show the fan. The
144 MHz PA board has a thermal cut-out switch that feeds back to
the PROT line on the main board. That doesn't seem to be
related to the fan operation, but rather to shut the transmitter
down for massive error conditions.

I'd have to take my 5100 apart, but from the implication of the
service book, it looks like the temperature sensor might be
integral to the fan itself.

You have the dahs on the thumb? I have dits on the thumb. Am I backwards?
I'd hate to think after all these years I've had my paddle backwards. But now
that I think about it, I've never used anyone else's. Or maybe it matters if
you are left or right handed? I send with my right hand, and the dits are on
the left paddle (thumb) and dahs are on the right paddle (fingers). Have I
got it wrong?

I read _Model Aviation_, the journal of the Academy of
Model Aeronautics, which we receive on an exchange basis.
I haven't seen any kit equipment advertised.

The only kits I've ever seen were made by Heathkit. In
fact, I repaired a few. Being very small, the receivers
were a nightmare to build, or troubleshoot and repair.

Radio-control modeling is popular enough now that
manufacturers can use custom ICs for many functions,
like encoding, decoding and detection.

There is another problem that might affect you, even if
you could build your own. Most clubs require you to join
the Academy before you fly on their property, as membership
includes liability insurance. Another requirement many clubs
have is use of a specific brand of transmitter and receiver.
The Futaba brand seems to be the winning choice. The concern
is off-frequency operation, which can cause a dangerous
crash. Even the R/C club that sails model sailboats in NYC's
Central Park requires members to use Futaba equipment!

: Assuming 100% modulation, 40 watts carrier would be 60 watts PEP.

Assuming 100% modulation, 40 watts carrier would be 160 watts PEP.
PEP power is 4 times the carrier (i.e. twice the voltage) for 100%
modulation AM.

Gary was confused by the fact that 100% modulating a 40 watt carrier
gives you 20 watts of sidebands, for a total AVERAGE power of 60 watts.
The peak envelope power is, however, 160W.

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: Amateur Radio licenses usually arrive between 8 and
10 weeks after the test session. The FCC considers their
processing time to be 90 days--from the date they receive the
application. The FCC usually receives the application one
to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will not receive a new license from the FCC.
The existing Technician license plus the CSCE conveying the Morse
code test credit is the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming six to eight week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing
classes and/or Novice examiners in your area; please contact
the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on
recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
find any examinations listed for your area, you may contact
any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
The 1993 Test Fee is $5.60.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;
(d) 907-786-8121, (n) 907-243-2221 (or) 907-276-5121
(or) 907-274-5546

C = Central Alabama VEC, 1215 Dale Dr SE, Huntsville, AL 35801;
205-536-3904

N = Charlotte VEC, 227 Bennett Ln, Charlotte, NC 28213;
704-596-2168

D = Great Lakes ARC VEC Inc., PO Box 273, Glenview, IL 60025;
708-486-8019

E = Golden Empire ARS, PO Box 508, Chico, CA 95927; No phone.

G = Greater Los Angeles ARG, 9737 Noble Ave, Sepulveda, CA 91343;
818-892-2068, 805-822-1473.

J = Jefferson ARC, PO Box 73665, Metairie, LA 70033; No phone

K = Koolau ARC, 45-529 Nakuluai St, Kaneohe, HI 96744;
808-235-4132

L = Laurel ARC Inc., PO Box 3039, Laurel, MD 20709-0039;
(d) 301-572-5124, 301-317-7819, (n) 301-588-3924

M = The Milwaukee RAC Inc., 1737 N 116th St, Wauwatosa, WI 53226;
414-774-6999. Test fee for 1993 is $5.00.

H = Mountain ARC, PO Box 234, Cumberland, MD 21502; 304-289-3576

P = PHD ARA Inc., PO Box 11, Liberty, MO 64068; 816-781-7313

R = Sandarc-VEC, PO Box 2446, La Mesa, CA 92044; 619-465-3926

S = Sunnyvale VEC ARC, PO Box 60142, Sunnyvale, CA 94088-0142;
408-255-9000

T = Triad Emergency ARC, 3504 Stonehurst Pl, High Point, NC 27260;
919-841-7576

W = Western Carolinas ARS VEC, 5833 Clinton Hwy - Suite 203,
Knoxville, TN 37912-2545; 615-688-7771.
The 1993 Test Fee is $5.60.

5 = W5YI-VEC, PO Box 565101, Dallas, TX 75356-5101; 817-461-6443
The 1993 Test Fee is $5.60.

EXAMINATION OPPORTUNITIES OUTSIDE THE UNITED STATES:

Really? Such profound comments from the Assistant Managing Editor of
QST! The VE team should have done something about that kid but they
chose to ignore it. Not a good idea.

Sherm--RS-10 and RS-12 both have 10 meter downlinks: 29.36 -
29.40 and 29.41 - 29.45 respectively. Get a satellite tracking
program like Quicktrack, load in the Keplerians that Kelso posts
here on the net, and the program will compute pass times. Works
slick!.

SB SPACE @ ARL $ARLS046
ARLS046 MODE B FOR PHASE 3D

ZCZC AS26
QST de W1AW
Space Bulletin 046 ARLS046
From ARRL Headquarters
Newington, CT August 2, 1993
To all radio amateurs

SB SPACE ARL ARLS046
ARLS046 MODE B FOR PHASE 3D

In a joint statement issued at the AMSAT-UK Colloquium, Ron Broadbent, G3AAJ, Honorary Secretary of AMSAT-UK, and Ray Soifer, W2RS, Executive Vice President of AMSAT-NA, announced that a 2-meter downlink transmitter for the Phase 3D satellite will be designed and built by Mike Dorsett, G6GEJ, as part of the international Phase 3D project team. Mike met with project leaders including Karl Meinzer, DJ4ZC, and Dick Jansson, WD4FAB, last week in Marburg, Germany, to discuss technical details. He also described his proposed design at the Colloquium, held at the University of Surrey on July 29 to August 1, 1993.

Together with the 70-cm uplink receiver already planned, this means that there will indeed be a Mode ''UV'' (formerly known as Mode B) capability on the new satellite. If all goes as expected, users of Mode B on OSCAR 13 can look forward to improved performance from Phase 3D.

G6GEJ is a well-known designer of high-performance VHF/UHF equipment. He is a long-time member of AMSAT-UK and his doing this work strictly on a volunteer basis.

Our thanks to Keith Baker, KB1SF, of AMSAT-NA for providing this information.

70. Bootlegger At ARRL N.E. Convention

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 16:18:46 UTC
From: babb@rapnet.sanders.lockheed.com
Message-ID: <1993Aug2.161846.7194@Rapnet.Sanders.Lockheed.Com>
Source record: 278496

I attended the ARRL New England Convention/Hamfest in Manchester, NH on July 24, 1993. As I stood in line to be checked in to the license exam sessions, I noticed that the rather-large lady ahead of me in line had a DJ-F1T on her belt, with a speaker-mic clipped to the collar of her blouse. I thought it unlikely that she would be allowed to bring the HT into the exam session. When she got to the check-in table at the door, the people behind the table asked her if she had any license/CSCE photocopies that she needed to attach to her 610. She replied that she didn't have a license yet, nor did she have any CSCEs. The man behind the table told her that she shouldn't even have the HT. Her response was to reach down and turn it off. In she went. I checked in, and headed down to the CW area to take my one remaining test (Element 1C) while a friend checked in behind me and went to the written-exam area to take her General written exam. After I blew the 1C exam (again, sigh) I waited outside for my friend. She passed the General written test, got her CSCE, and met me and we went to lunch. As we ate, I noticed the same "I don't have a license" lady walking along, yakking away into her speaker-mic. I was quite surprised at her blatant bootlegging (If she didn't have a license before the test, she didn't have a callsign, no matter what happened at the test.) I pointed her out to my friend. My friend said that she had heard the VE telling the lady that she had blown whatever exam she had taken, and then the lady had gotten up and left (confirming what my friend had heard, since the lady didn't wait around for a CSCE.)

I felt that I should do something about this bootlegger, so I went back up to the examination room to speak to the head of the VE team. The gate guards had no idea what to do with me. I wasn't there to take an exam, so they weren't about to let me into the room to speak to anyone. I explained the bootlegger situation, and they suggested that I go speak to someone at the ARRL info booth. Off I went. When I got to the ARRL info booth, I asked the info-man if there were any FCC officials at the convention. He said that there were none that he knew of, unless they were "undercover" (his word.) I explained the Bootlegger Massacree (with 4-part harmony, etc.) yet again and asked him what he suggested. He suggested that there was nothing that could be done. I was surprised, to say the least.

I understand that Amateur Radio is supposed to be self-policing, and I was making an attempt to police our hobby. Should I have expected a little help or support from the organization that purports to be our representative body?

From: mohan@tulip
Message-ID: <1993Aug2.112044.5110@uoft02.utoledo.edu>
Source record: 278484

Hello,

I have got a Kenwood AT-250 Automatic Antenna Tuner, and want to use it with a Kenwood TS-520S transceiver.

I dont have the instruction manual for the antenna tuner and need help to use it correctly. Actually I tried to tune up my ts-520s yesterday and somehow manages to increase the swr to more than 3:1.

I now have dipoles for the 40m, 20m, 15m and 10m and eagerly waiting for license.

Thanks for any info you give me.

Sounds like flame bait to me!

You failed to mention that you only tried this setup into a dummy load.
I'll assume that was what you did since almost anything else would be
illegal and would incur the wrath of the net!

Advice: Wait until your license comes! In the meantime, join your local
radio club and ask for help there. Maybe one of the guys could
stop by and show how to use it.

I finally went to a portable with an LCD screen. Now everything is
quiet (except for the little birdies put out by the MFJ 1278, that
is :-).

Your milage may vary. The portable I am using is a (what else, we
get employeee discounts) PowerBook Duo, without the docking station.

The Macs generally do pretty well. My IIci hardly puts out any
garbage. But, the Mac 13" RGB monitor? Hoo boy! One of the all time
best monitor for colour work, but not what you want to use with HF
RTTY/Amtor/packet. At least, at my QTH.

From: david@bu.edu
Message-ID: <23jgtq$eqo@news.bu.edu>
Source record: 278502

In the hopefully not too distant future I will be receiving my amateur radio license, and I would like to be able to take my 2m handheld when I go on vacation or a business trip.

If I am flying there, I would like to be able to put my radio in my carry on luggage, and I was wondering if there were any problems with doing this. I realize that they will probably shoot you if you start transmitting or such while on the plane, but I would like to know if airport security will let you on the plane with it in carry on luggage.

Also, can you transmit from within an airline terminal, or is there a chance that you will be causing harmful interference to anyone? Also, will they let you do it? Any replies will be appreciated.

|> : ("dit dit")

1956-1957 timeframe and thereafter for a while, novices and others
were tired of sending "CQ CQ CQ de CALL CALL CALL K" and longer
CQs also. so along came the 'shave and a haircut' bit. the calling
station, i.e. the one who would normally be calling CQ would sit on
frequency (after determining if it was in use) sending the 'shave and
a haircut' with the dit side of their bugs or whatever. if another
station came and along and wanted to talk to him/her they would send
'six bits' or E E. control of the freqency went back to the 'caller'
and he/she would send their call and start the qso or send their
call and the other station would send 'CALL de CALL2 K' and off would
go the qso.

purpose: to shorten the start up time of a qso, especially if you were
doing only 5 to 10 wpm. you call a "CQ" in three seconds this way.

no call and no area, but nobody cared.

after the qso was over, the qso would end with,

'.... SK CALL de CALL2 <shave and a haircut>'

' .... SK CALL2 de CALL <six bits>' where <six bits> is the EE that we (those of us that remember use and still smile when we do it) and others that imitate do. it's kinda like secret handshakes, someone will one of these tell you what all the fuss is about, but only if you ask nicely. ;-)

73 de k5fo dit dit

p.s. the reason we don't do this today? the FCC started issueing 'pink slips' for doing this. i didn't get one and am glad that i didn't. :-)

someone put this thread in the FAQ.

dit dit

80. Old Prosigns

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 17:21:15 UTC
From: jkearman@arrl.org
Message-ID: <1915@arrl.org>
Source record: 278572

You would expect someone who worked at Headquarters
to be fully conversant in CW prosigns, right? And
I'm no Morris minor, either! I'm sorry. It won't
happen again. Please don't paddle me.

Last week I said dididididahdit was intended to get
the receiving station's attention. I was wrong.
This prosign meant "understood," a precursor to
didahdit, for "received okay." So, why do some OTs
send dididididahdit just before calling CQ? Dunno.
Always makes me laugh, though, because it sounds
like Woody Woodpecker's song.

If you care, the prosign to get the other station's
attention was dahdidahdidahdit.

Best regardses,

KR1S

A hearty thank you to any of the ARRL folks that are
reading this. The recent series of 'hollow state'
homebrewing and operating articles have been great.
Keep 'em coming.

Now, where is the tube-type transmitter article threatened
to match the receiver project?

82. Making Trees Taller: Mounting Mast in Tree ??

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 17:44:56 UTC
From: brucec@tekgen.bv.tek.com
Message-ID: <3531@tekgen.bv.tek.com>
Source record: 278514
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc

In my quest to build a big lazy H in my trees, it has become apparent that an extra 15 - 20 feet would help. Has anyone had experience mounting a mast on top of a tree (s)?

What kind of mast did you use? What kind of clamp ? What connection structure at the top of the mast?

Of course, I could wait about 10 years and the tree might grow that high. Reminds me of an old brain teaser - A man 6 feet tall pounds a nail in a tree at his height. The tree grows 1 foot per year. Ten years later he comes back. He hasn't shrunk. How high is the nail above his head now?

I will answer after I get responses to my post!

Bruce Cheney NI7M

Here's a thought about dididididahdit... it is the reverse of AS, didahdididit.
AS means stand-by, I will not be transmitting; when you recommence
transmitting you send the reverse or dididididahdit meaning you are starting
to transmit again.

Don't know if it's true, but I like the symmetry.

84. Re: W9GR Low cost DSP kit ...

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 17:50:25 UTC
From: greg_chartrand@qmail.ssc.gov
Message-ID: <1993Aug2.175025.22171@sunova.ssc.gov>
Source record: 278508

I have a W9GR board and have developed a simple clipper modification which really helps the
limitations of the A/D converter. I found the problems associated with the limited A/D range most annoying when listening to signals BELOW the AGC threshold of the receiver, i.e. weak signals. That when I most want to use the filter.

In my humble opinion, I find the filter not to be very effective in enhancing weak signals. It is better suited as an accessory that makes "casual" listening less irritating.

>will they let you do it? Any replies will be appreciated.

Congratulations on your imminent license!

There was a thread on this general subject (HTs and aviation)
about four months ago.

If you go to a country where radios are illegal, I suppose you will
have to consider the radio might be confiscated at customs there.
If you get a reciprocal ham permit first, the permit should be
enough to overcome any suspicions at customs.

You would be smart to get a customs form before you go, showing that
you had it before you began your trip. That way, you don't have to
worry about US customs trying to hit you up for duties upon your return.
That US customs form may be of some help in the customs of other
countries, too.

I expect there are airports where the guards are very worried about
terrorists, where the guards would get nervous when they see you
pull out and talk into your HT. But in the US, at least, if you
have the ham license and are otherwise transmitting legally, your
mere status as standing on the ground at an airport should not keep you from
transmitting.

As you know, transmitting while on board a commercial aircraft is
a no-no. The pilot does not have the power to let you do it.

On a private plane, you would have to satisfy Part 97, with
permission of pilot etc.

In rec.radio.amateur.misc, plaws@uafhp.uark.edu (Peter Laws) writes:
>Help!!
>
>We are looking for any listings for our club (ARC of the University of
>Arkansas) for the period before 1950.
>
>Our call now is W5YM and has been since 1951. It was also W5YM in the
>early 1930s (it was 5YM in the '20s). We also understand that we were
>W5JNI in the '40s.
>

I took this as a personal challenge and did some digging on your
behalf...

In October of 1949, Joe Olson W5OXR wrote to us stating

"I am writing on behalf of the University of Arkansas
Amateur Radio Club to request necessary forms and information
to make our club an ARRL affiliate.

"We have a membership of about 25 at present. About 15 of this
group are licensed.

"We are especially interested in obtaining the training
aids available to affilated clubs. The University
is an excellent source of prospective amateurs. We are
conducting code and theory classes now. The club also
has station W5JNI, consisting of a 610 transmitter and
312 and 342 receivers"

Later that year, the club forwarded to us their
Articles of Association and membership bylaws (which we
still have in our archives!) They also sent us a complete
list of their members, which we have.

On December 19 1949, affiliation with the American Radio Relay
League was granted. There's a letter here with two ounces
of AIR MAIL postage on it, an ounce being worth six cents
at that time...

In December of 1949, the President of your club was W5LOK
and the Secretary was W5OPW, both of Fayetteville.

Our files for this particular club contain a black and
white glossy of club members in 1958, and the following
interesting letter from Frederic Spies, K5IIX
Assistant Professor Law:

"During the past year this club, which was rather loosely organized
in the past, has undergone a complete renovation. I have incorporated
it under a new name, which appears on the letterhead...

"currently our main project is the refurbishing of an Army surplus
communications truck, which has been standing dormant on the parking
lot here for some years. The membership, under the the eager
aegis of W5TJI, Chappie Allsopp, has responded nobly, and the
reconditioning should be complete by the end of May.

"Jim Haynes K5PIB (pictured) an EE graduate assistance, has put
the club station W5YM, on RTTY, with all new IBM equipment
we received as a gift last spring. To our knowledge W5YM
is the only active RTTY station in the state. Jim
presently is developing an auto start system for it with the
help of Mr. RTTY, W9TCJ.

"We are particularly proud of the Razorback Award which came into
being just last week. A sample is enclosed, with an instruction
sheet for obtaining the award - which the club members now
send with their QSLs. We certainly would appreciate any
publicity you could give us in QST...

Thought you'd find the above info interesting!

If you can use solder wick, the mod is 10 minutes (remove a blob on a
pc board)

The battery voltmeter on the 530 should be a standard HT feature.
ditto for the CTCSS scan feature (scans all of the CTCSS tones to
see which one is being used for rptr access for instance)
Rx AND Tx Power Saver is slick too.

I'm thinking about atarting amateur radio as a hobby. I have started
studying for the technician license (using the ARRL book Now Your Talking).

The question I have is what type of radio to buy. There are two models
at my local Radio Shack, one in the 10m range and one in the 2m range.
Which band is more commonly used 10m or 2m (I understand it depends
on area)? Also any info on what to look for and what to buy would help.

I agree. For weak signals (signal-to-noise ratio close to 0 dB), the noise-reduction filter makes very litle difference. But for moderately strong signals, the noise reduction is dramatic.

The automatic notch filter also works great. I don't do a lot of SSB operating, but it seems to take those "tuner-uppers" right out.

The hobby is self-policing. That doesn't mean we're policemen.

It means that we encourage people - by good example and by use of peer pressure - to obey the rules.

That does NOT mean we go around playing radio cop.

(Oh, and I can think of a way in which it would have been legal for that woman to be talking on that walkie. Can your insurance handle the enormous award for false arrest for which you might have been liable?)

You bet, Tom -- here's the usual blurb I post here every week or
so which will answer your questions nicely...

--

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
-
2. Listings of Amateur Radio clubs in his location.
-
3. Helpful promotional material about the Amateur Radio
Service.
-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
-
To obtain any of these, simply provide me with:
-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services

above.
-

Gary Coffman (gary@ke4zv.uucp) wrote:

: We call it a GFI, Ground Fault Interrupter.

: Our 110 volt residential wiring consists of three insulated wires, the
: hot (black), the neutral (white), and the safety ground (green). The
: safety ground *can* be bare under certain conditions, but the other
: two are insulated. The safety ground and the neutral lead must be
: connected together at the distribution panel, where they're both
: connected to Earth ground, but they aren't supposed to be connected
: together anywhere else
..
: A GFI is configured to measure current flow in this
: third wire. If it exceeds a minimum value, it trips the hot lead
: out of circuit.

I thought that the GFI measured the differential current in the hot and
neutral wires. If the GFI sensed ground-lead current, then if you touch a
"hot" wire while standing on earth ground (swimming pool, for example),
the GFI would not trip. (Since the return current would be through the
earth, not the safety ground.)

: Our 220 volt systems can be more complex. They can be either single
: phase, or one of two different varieties of three phase. In residential
: wiring single phase is normally used and all three wires usually carry
: current. Two of the wires are "hot" and one is neutral. From either hot
: wire to neutral, you get 110 volts. From one hot wire to the other, you
: get 220 volts. Note the absence of a separate safety lead.

This brings up an interesting question: My (old) electric stove has a
3-prong 220V plug on it. It also has a 3-wire 110V AC outlet for plugging
in your coffee pot or whatever. I assume the 110V outlet's neutral and
safety ground leads must just be wired together to 220V neutral. Isn't
this some kind of violation of the electrical code?

: Ideally, loads are balanced so no *net* current flows in the neutral lead,
: thus it can be considered "ground", but this rarely happens in practice.

I assume that's the way my stove works. There would be no reason to wire
the burners to the third wire. For sure my linear amplifier doesn't put
current into the third lead. What kind of 220V load would intentionally
draw current from the neutral lead?

Hi,

I just bought a new/used 850S no autotuner with the 500hz CW
8.83 filter and ic232 interface.

I was wondering about the differences in performance between
the 8.83s and the 455 IF filters.. What are the advantages
and disadvantages.. I was thinking about either adding the
270 8.83 or the 250khz 455.

Any other musts for this radio..I am still thinking about
saving for the internal tuner.. i have a band quad and a
Gap vertical..most of my antennas have good SWRs.. and have
an AEA manual tuner for use with getting them to work on
non-resonant bands for my QRP rigs (works well..the quad
does a great job on 30+40)

thanks

96. Tower Grounding Opinions

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 19:21:58 UTC
From: levine@mc.com
Message-ID: <23jpgm$h5p@jericho.mc.com>
Source record: 278520

The popular belief is that we don't connect
the rebar iin the concrete base to the tower
because the concrete bease can explode if there is
a lightning hit or nearby hit. Polyphaser (a well
respected company) says this is an old myth and
not true. They say to connect the rebar to the
tower as shown below. They say a base can crack if
because the current (from the lightning hit) can arc
to ground because the current density in the base is
very high. They specifically say you SHOULD connect
the tower to the rebar to increase the amount of
metal (conductive material) in the base. This
DECREASES the current density in the metal in the base
REDUCING the chance of cracking the base during a hit.
Furthermore, they say to then connect the tower to
metal ground radials. So effectively it seems that
everyting is now grounded as well as good as it can be;
base section, tower, rebar, etc...

Tower

```
|| || #2 wire connecting
|| || / tower to rebar
|| || /
|| |+---+
|| || |
~~~~~~~~~~~~~~~~~~||~~||~~~|~~~~~~~~~~~~ Ground Level
| || || +-+| . | +--------+ |
| | || || | <---concrete
| +--------+ |
| | || || |<-------rebar
tower base | +--------+ |
section | | || || | |
---------->|| || |
|_____________|
```

(if this isnt clear on your screen, the rebar is connected
to the tower through some #2 wire coming up through the base
to the tower bottom section)

This is straight out of Ploy phaser's catalog and newsletter.
Anyone with REAL knowledge or experience out there?

97. OMNI-D series C manual?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-02 19:24:35 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9308021224.aa29957@Paris.ics.uci.edu>
Source record: 278519
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Anyone have an OMNI C (546C) manual out there?

Someone sold me one, but had no manual. He called Ten Tec and asked them
to send me one. Well, I got the OMNI D manual, and alignment will not
be the same, since the OMNI C had WARD, and the variable caps and inductors
are going to have a different pattern. Yuck.

SO....anyone know about aligning the OMNI C? Anyone have a manual? I
will get another from Ten Tec if I cannot get a response here, but I
would like to get it soon, if possible.

Thanks,

Clark

>and the null effect, a.k.a the Adams Effect.

We localize the direction of sound based upon a number of factors. For high frequency sounds, amplitude is the dominant characteristic. It would be very difficult to use the phase information because the wavelength is so short. (I would be happy to explain this further.) For lower frequencies, phase is the dominant characteristic for localization. Note, in both cases I refer to localization in the horizontal plane: left-right, front-back. Detecting the elevation of a sound, especially along the midline of the body, is more difficult and depends upon the bandwidth of the sound and the complex folding of the ear lobe.

Picking a signal out of the noise (QRN and QRM) is a complex process called auditory scene analysis. It requires more than localization. It would be interesting to build a circuit that makes different cw signals (or voice signals) sound like they come from different locations in space. It would make picking out the signal a lot easier, I suspect. Just a thought, I have no (good) idea how to do it!

Hmmm.... kind of makes you wonder who she was talking to and what call she
was using - if any. I guess a good move would have been to find out what
frequency she was on and see if a licensed amateur was talking to her - and
then contact them. Another possibility is that she was not really talking
to anyone, and not even transmitting - just wanted to draw attention...

You are right - for a self policing organization, many hams seem as
unwilling as the FCC to do anything - and those that are willing can get
no support in actually resolving a problem.

>G
>Gordon AB5Dg

I wouldn't recommend this for other than a temporary measure. Why?
Because the pendulum rod of a bug isn't perfectly rigid, particularly
if the bug is a flat-pendulum Vibroplex (Lightning Bug, Champion,
Zephyr). You can actually feel subtle resonances as you move the
speed weight in and out. Adding additional length is going to make
the pendulum "whippy" (for lack of a better word). In other words,
the pendulum itself vibrates like a plucked string, and these
resonances interfere with the bug's timing, particularly dot timing.

I'd use whatever is convenient for additional weight. This includes
washers, alligator clips, clothespins, solder, etc.

Old-time telegraphers used another method -- they filed a notch in
the bug's mainspring. Historically interesting, and probably does
work better than additional weight, but PLEASE DON"T DO IT!

Message-ID: <1993Aug2.145400.8333@pimacc.pima.edu>
Source record: 278303

As I was drooling over the latest HRO catalog and then looking at
my checking account balance (for the first time in months I didn't cry)
I have decided that I can afford a new toy.. (Please no messages requesting
grants - It's not that big ;))

The Need: A mobile HF antenna that gives me the spectrum of bands built
of tough materials that will last.

The Requirements: I am a Tech+ (with a little luck soon to be General)
and a member of Civil Air Patrol. The antenna is going on a CAP van that
will be used to transport Ground search and rescue teams to their
search sites. I also want to use the rig for my personal entertainment -
thus the multi-band requirment.

The Question: Has anyone out there used the Outbacker JR? What are the
other choices? How is the performance of the Outbacker vs the others?

Thanks for the replys - Mike

A discussion just started up in rec.radio.amateur.homebrew on building a system described a number of years back that used a low pass filter to the left ear and high pass filter to the right, giving you 'spatial' differentiation of signals at different tones. The original author claimed that it made picking one cw signal out of a group in the filter passband much easier since they appeared to come from different locations. From your posting, sounds like that might well be true.

Someday I'll get time to build one of those...

When we had out local amateur radio field day at Wyong (NSW Central Coast, about half way between Sydney and Newcastle), I checked out the DJ-F1T. I currently have a DJ-X1 scanner, which is built into the same case as the DJ-F1T, and all I can say is to echo your comments about it's ruggedness.

As I don't yet have an Australian amateur license, I can't own a transceiver, but I have the DJ-F1T in my sights!

> I don't have the high-power version, but be aware that this is just a

The thing I like is that you can put an empty dry cell case on the back, and put a different battery pack somewhere else on your belt, or in the pocket. When I took my DJ-X1 to Melbourne last year for a steam train festival (Melbourne is about 1000 km south from Sydney), I travelled by train, and used a little power pack I had built up to plug into the 240 volt mains outlet on in the sleeping compartment I was in to run the radio until the next day. It saved me heaps on batteries, sinec I didn't have a Nicad charger then.

Gary sez:
>And because the sidebands are in quadrature,
>cos((w+p)*t)*cos((w-p)*t) = sqrt(2)*cos(wt).
>So the combined vector amplitude of the sidebands can be expressed as
>sqrt(2)*.5*Ma*Ao*cos(wt) or 0.707*Ma*Ao*cos(wt)

I don't understand why you are multipling the sidebands times each other.
Please explain.

Then again I can't see why this has gone on so far. I don't see why we
need lots of references when the math is so straight forward. As Al
said, the AM signal voltage is (1+M s(t))cos(wt). If M = 1 and
-1<= s(t) <=1 (ie 100% modulation), at some point the AM signal voltage
will be 2 and the power will be 4 times the carrier power. Don't
complicate things with vector diagrams until you can find a hole in
this simple explaination (A variant of the KISS principal)

>a wiring error and swapped hot and neutral. In that case, you can
>still be dead meat.

Not true. Earth ground is NOT needed for and is not involved in proper GFI
operation.

GFIs work by measuring any asymetry in current flow that may exist
between the hot and neutral leads, the assumption being that any
current not making the return trip is going somewhere it does not
belong.

The most common way of detecting this imbalance is with a longitudinal
transformer. This consists of a core with two primary windings and one
secondary. One primary conducts the hot leg and the other conducts
the neutral. They are phased so the fields cancel. Therefore when
the current is balanced (everything going out comes back) there is
no current induced in the secondary. If some of the current finds
an alternate route back to ground, the currents in the primaries are
unbalanced and current is induced in the secondary. This secondary
current is measured and when it exceeds a set value, the GFI trips.

Still available in San Jose, a few TEMPEST-qualified very low radiation IBM-XT's, with mono or CGA monitors and keyboards, with all of the above mentioned shielding techniques already done. $99 for the basic unit including mono monitor, keyboard and 1 360K floppy. This is the normal big XT motherboard, so you can put anything in it you'd like. They also have cases and power supplies alone for $20-25, I think.

Advanced Component Electronics, 1534 Berger Drive, San Jose CA 95112, 408-297-1383. I have no connection with them except as a satisfied customer.

I thought this thread was finished long ago. True, the pilot alone does not have the power to let you transmit on board a commercial airliner. But if the holder of the air transport certificate (the airline) has so instructed pilots, they may authorize the operation of any portable electronic device they wish. Certain commercial and common-carrier RF devices, specifically cellular phones, are prohibited by FCC regulation from being used while airborne, but amateur transmissions are not so controlled, and a few air carriers will still permit their pilots to approve amateur operations enroute. Ask the airline what their policy is. I have seen no prohibition of this in either part 121 (normal air carriers) or part 135 (air taxi).

David-

As I understand the US rules, it is OK to have a radio on board an aircraft, but NOT to transmit with it. However, some security/baggage checking people may still give you a hard time.

I carried a ten watt mobile radio on an aircraft once. I was going across the state to pick up a car. I was barely able to talk the inspectors out of opening up the radio to verify that the "battery" was removed! At that time, they apparently had orders to be sure that any hand-held carried on board, had the battery disconnected, so no accidental transmission could occur.

If a misinformed security guard gives you a hard time, you must be careful not to upset them. I have heard of some cases of people landing in jail for fairly innocent things, when they voiced too loud an objection. This problem could be extremely serious in a foreign airport.

Life isn't fair!

Ground fault interrupters do indeed measure the difference in line-to-neutral current, not the ground current per se. They do this by passing line and neutral conductors through a toroidal transformer core; these become two (common-mode) single turn primaries. The secondary coil (many turns around the toroid) trips a breaker if the difference of the hot and neutral current is greater than ~5mA.

There are GFCIs for 220 volt use, but they're rare. I was considering using one for my swimming pool pump motor, but decided it was easier to run the pump on 110V instead and eat the extra I^2R loss.

Regarding 220V wiring: I believe the requirement of the NEC is that you may run three wire 220 (hot1-hot2-gnd) ONLY if the appliance has no 110 volt circuits; hence Al's stove is a flagrant violation... presumably the code was a bit more lenient once upon a time. Many electric clothes dryers are hooked up this way with 3 prong plugs.

For most 220 circuits that include 110V taps, you must run four-wire 220 (hot1-hot2-neut-gnd). A modern stove with 220V burners and a 110V vent fan fits this category.

Note that the safety ground is never omitted from 220V wiring, but sometimes the neutral conductor is.

well, I got an email answer that helped me quite a bit. Basically it is considereddd bad nettiquete (sp) to post binary files into NON binary newgroups. Makes perfect sense to me. Now, do we (hams) *have* a binary posting newsgroup (rec.radio.amateur.binary?) that we CAN put stuff of a share/freeware nature? One doesn't appear on my server but that doesn't mean it's not out there. I ask this specifically for the untold number of us that have access to the net but for one reason or another do not have FTP access to the net or to any of the archive sites (picture of myself holding hand in the air with sheepish grin). So, do we have one (binary area)? Do we need one? Anyone with more experience than myself (oldtimer of 6 weeks now on the net!) have a suggestion or want to volunteer to be a moderator of a new group (I don't have a clue as to what's involved in even creating a new group, who to talk to, etc.).

Listening to audio from any source with a phase difference between ears
just drives me crazy. Always has. Like some people react to fingernails
on blackboards.

I read "The Complete DXer" and at first couldn't believe the advice to
wire headphones out of phase for enhanced CW copy. Then I realized maybe
other people can stand listening to stereo 180 degrees out of phase.

Now I'm curious: do many other people suffer this same out-of-phase aversion?

121. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 01:33:21 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.744341601@afit.af.mil>
Source record: 278315
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

122. SSB vs AM Peak Power (Was T50 Illegal!)

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 01:36:48 UTC
From: alanb@sr.hp.com
Message-ID: <CB5ttD.8A3@srgenprp.sr.hp.com>
Source record: 278447

I decided to start a new string since this has drifted way away from the original subject.

Erik van Bronkhorst (erik@peewee.chinalake.navy.mil) wrote:

: ... What is the relative
: PEP of an SSB signal versus AM that creates an equivalent amount of
: heat in a resistive load?

It depends on the modulation waveform. For sine-wave modulation, the SSB signal is a constant-amplitude RF signal. Peak Envelope Power (PEP) = average power = power dissipated in a resistive load.

For an AM signal with 100% sine-wave modulation, power in the sidebands is 1/2 the carrier power, so power dissipated in the load = 1.5 times carrier power. PEP is 4 times carrier power. So the ratio of PEP to average dissipation in the load is 4 / 1.5 = 8/3 = 2.67.

What is more interesting is to compare "talk power" of the two methods. Assuming the transmitter is limited by its PEP rating (rather than average power rating), the sideband power with SSB is equal to PEP. With AM, sideband power is 1/2 the carrier or 1/8 PEP, for a 9 dB disadvantage.

[To further complicate matters, the two sidebands in AM combine in the receiver's detector to give 1.4 times (+3 dB) the detected audio compared with an SSB signal with the same total sideband power. However, the AM receiver needs twice the IF bandwidth which causes a 3 dB degradation in signal-to-noise ratio, so we're still left with a 9 dB advantage for SSB.]

: Your college library should have the Code of Federal Regulations in their
: government documents section. Look at Title 47, Part 15.

: :- Michael A. Covington, Associate Research Scientist : *****

I'm interested in one of the topics the original poster asked
about, ie whether kits need certification. So I went to the
campus library and read up on the CFR Title 47, Part 15 of
10 Oct 92. Although the section does in fact speak to the issue of
compliance by kits, the actual paragraph that treats the subject,
15.25, pretty narrowly defines "kits" to be only "TV interface devices"
(aka RF modulators). In section 15.3p a kit is defined as a full or
partial complement of parts with instructions that when assembled
would be subject to part 15. If one takes part 15 in literal
translation, one would have to seek certification for an RF modulator
kit (or cable TV interface unit kit), or anything else that attaches
to a consumer television set. Whether a computer interface peripheral
board kit (with external connections outside the computer) needs
certification is not spoken to in part 15, as far as I can tell.

The section on homegrown equipment is very generous, ie they
specifically recognize that people may not necessarily have the
equipment to verify compliance, and require only "good engineering
practice". IMO, they should have left the issue of kits under
the homebuilt devices paragraph (15.23) and left compliance to
the kit builder.

BTW, I would like to hear from anyone who has assembled a kit recently
which included anything along the lines of an FCC compliance statement.

The net is a bad place to get legal advice, so don't base any decisions
on the need for certification solely on this posting!

127. Re: Handhelds on airplanes

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 02:23:15 UTC
From: wtm@uhura.neoucom.edu
Message-ID: <1993Aug03.022315.12221@uhura.neoucom.edu>
Source record: 278451

I haven't taken my hand-held radio on a plane yet, but I have carried it into the Hopkins airport in Cleveland, Ohio several times. The reaction has been totally nonchalant to almost a third degree cross examination. I also have a motorola pocket pager; the pager hasn't raised any suspicion yet. I've always voluntarily put my HT and pager on the X-ray machine. The time I was questioned vigorously on my HT, it seemed to be such that the guards wanted to sure my HT was not a cellular phone. One time, the guard started asking questions about my HT, so I thought I was going to be in for a rough time. It turned out that she (the guard) had seen several other HTs and wondered what they were; it wasn't too busy so I had a chance to give a brief explanation of amateur radio.

The net result is that it depends upon the moods of the security guards, customs agents, flight attendants, pilot, etc. etc. whether or not you'll be able to take your HT in your carry-on luggage.

Speaking of the voltmeter on the Yaesu 530...

Something I'd like to see on an HT is an mAH meter. It doesn't seem like it would be too difficult for an HT's microprocessor to integrate the current flow from the battery. The terminal voltage on ni-cd batteries doesn't drop very much until they're about spent. Integrating the current consumption might give a little more useful indication of the amount of charge left in the battery.

The idea of integrating current consumption has been done after a fashion with a TSR program for portable DOS computers. The program called Battery Watch keeps track of how long the various subsystems of the portable have been running: HDU, floppy, etc. The times are multiplied by the estimate of the subsystems' draw then totalized. The same procedure could be used by the HT's microprocessor since the approximate current draw for the various subsystems is known, the micro doesn't need to measure current flow directly.

Another thing that would be nice to have would be some sort of audio anunciatior that would chirp if the battery voltage drops too low to power the radio while the the unit is keyed in transmit state. It is rather aggrivating to discover taht I've been talking into a dead HT for the last minute or so

Heaven only knows if these ideas are patented. If they aren't, I said it first! :-).

129. 2M/70cm Activity in the Virgin Islands?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 02:43:54 UTC
From: Alex Rudd <AHRJJ@CUNYVM.BITNET>
Message-ID: <93214.224354AHRJJ@CUNYVM.BITNET>
Source record: 278453

I'm leaving in a little over a week for the U.S. Virgin Islands. Naturally, the allure in signing /KP2 is pretty strong, but as it is, I own no HF gear. Is it worth it to bring my 2M/70cm HT? Anyone know whether there's any VHF/UHF down there, either on St. John or St. Thomas, or even on one of the BVI islands? Maybe even a repeater (or is that hoping too much?)...

Please reply directly, not to the group.

Thanks!

A great application for digital filtering, but I was thinking that
just frequency filtering is not the only answer. (I'm not sure
what is the better answer.)

131. New 97.113 Text

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 04:04:59 UTC
From: marcbg@feenix.metronet.com
Message-ID: <CB60oB.EnM@feenix.metronet.com>
Source record: 278459

The following is the 1993 change to FCC rule 97.113

97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(1) Communications specifically prohibited elsewhere in this Part:

(2) Communications for hire or for material compensation, direct or indirect, paid or promised, except as otherwise provided in these rules;

(3) Communications in which the station licensee or control operator has a pecuniary interest, including communications on behalf of an employer. Amateur operators may, however, notify other amateur operators of the availability for sale or trade, of apparatus normally used in an amateur station, provided that such activity is not conducted on a regular basis;

(4) Music using a phone emission except as specifically provided elsewhere in this Section; Communications intended to facilitate a criminal act; Messages in codes or ciphers intended to obscure the meaning thereof, except as otherwise provided herein; Obscene or indecent words or language; or false or deceptive messages, signals, or identification;

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

(b) An amateur station shall not engage in any form of broadcasting, nor may an amateur station transmit one-way communications except as specifically provided in these rules; nor shall an amateur station engage in any activity related to program production or newsgathering for broadcasting purposes, except that communications directly related to the immediate safety of human life or the protection of property may be provided by amateur stations to broadcasters for dissemination to the public where no other means of communication is reasonably available before or at the time of the event.
(c) A control operator may accept compensation as an incident of a teaching position during periods of time when an amateur station is used by that teacher as a part of classroom instruction at an educational institution.
(d) A control operator of a club station may accept compensation for the periods of time when the station is transmitting telegraphy practice or information bulletins, provided that the station transmits such telegraphy practice and bulletins for at least 40 hours per week; schedules operations on at least six amateur service MF and HF bands using reasonable measures to maximize coverage; where the schedule of normal operating times and frequencies is published at least 30 days in

advance of the actual transmissions; and where the control operator does not accept any direct or indirect compensation for any other service as a control operator.
(e) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations,
and communications, including incidental music, originating on United States Government frequencies between a space shuttle and its associated Earth stations. Prior approval for shuttle retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur operators. Propagation, weather forecasts, and shuttle retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.
(f) No amateur station, except an auxiliary, repeater or space station, may automatically retransmit the radio signals of other amateur stations.

SB SPACE @ ARL $ARLS046
ARLS046 MODE B FOR PHASE 3D

ZCZC AS26
QST de W1AW
Space Bulletin 046 ARLS046
From ARRL Headquarters
Newington, CT August 2, 1993
To all radio amateurs

SB SPACE ARL ARLS046
ARLS046 MODE B FOR PHASE 3D

In a joint statement issued at the AMSAT-UK Colloquium, Ron Broadbent, G3AAJ, Honorary Secretary of AMSAT-UK, and Ray Soifer, W2RS, Executive Vice President of AMSAT-NA, announced that a 2-meter downlink transmitter for the Phase 3D satellite will be designed and built by Mike Dorsett, G6GEJ, as part of the international Phase 3D project team. Mike met with project leaders including Karl Meinzer, DJ4ZC, and Dick Jansson, WD4FAB, last week in Marburg, Germany, to discuss technical details. He also described his proposed design at the Colloquium, held at the University of Surrey on July 29 to August 1, 1993.

Together with the 70-cm uplink receiver already planned, this means that there will indeed be a Mode ''UV'' (formerly known as Mode B) capability on the new satellite. If all goes as expected, users of Mode B on OSCAR 13 can look forward to improved performance from Phase 3D.

G6GEJ is a well-known designer of high-performance VHF/UHF equipment. He is a long-time member of AMSAT-UK and his doing this work strictly on a volunteer basis.

Our thanks to Keith Baker, KB1SF, of AMSAT-NA for providing this information.

In article <23jgtq$eqo@news.bu.edu> david@med-buspheb.bu.edu writes:
>In the hopefully not too distant future I will be receiving my amateur radio
>license, and I would like to be able to take my 2m handheld when I go on
>vacation or a business trip.

Its 100 degrees F in the shade. But how do I know its summer
time? Because people are posting questions about carrying
walkie-talkies on planes.

You can carry a walkie-talkie on a plane - even Aeroflot. You
can use it in the terminal - you can even order a pizza. If you are
within 200 miles of the border you can order extra Canadian bacon for
no extra charge.

Vacationers in Hawaii get extra pinapple if waiting for a
delayed flight to another island.

135. Alinco 580 questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 04:30:01 UTC
From: flinxwei@magnus.acs.ohio-state.edu
Message-ID: <23kpk9$4n5@charm.magnus.acs.ohio-state.edu>
Source record: 278457

Would someone who owns a 580 kindly answer the following questions:

-what is the RX range(s) after complete modification

-what is the TX range(s) after complete modification

-if you were to purchase another dual band HT tomorrow,
would it be a 580? If not, what would it be?

Thanks for your help. I have a F1T right now, and am considering a 580 or an
Icom W2A. Considering I am the new president of a ham club with a 70cm
repeater, I had best be getting a 440 rig!

: Regarding 220V wiring: I believe the requirement of the NEC is that
: you may run three wire 220 (hot1-hot2-gnd) ONLY if the appliance has
: no 110 volt circuits; hence Al's stove is a flagrant violation...
NOT
: presumably the code was a bit more lenient once upon a time. Many
: electric clothes dryers are hooked up this way with 3 prong plugs.

And there is a specific section 250-60 that allows this today (1993 NEC)

: For most 220 circuits that include 110V taps, you must run four-wire
: 220 (hot1-hot2-neut-gnd). A modern stove with 220V burners and a 110V
: vent fan fits this category.
Yup
: Note that the safety ground is never omitted from 220V wiring, but
: sometimes the neutral conductor is.
WRONG - the 'neutral' IS the grounded circuit conductor in a 3 wire
220v service.

Actually, just the opposite - Frames of Ranges... shall be permitted
to be grounded to the grounded circuit conductor [white] if all of the
conditions in (a) through (d) are met. Mail me if I should key it in.

Source record: 278464

: Gary Coffman (gary@ke4zv.uucp) wrote:

: : We call it a GFI, Ground Fault Interrupter.

According to the NEC, GFCI = Ground Fault Circuit Interrupter. It
doesn't interrupt the ground fault.

A device intended for the protection of personnel that
functions to deenergize a circuit or portion thereof within
an established period of time when a current to ground exceeds
some predetermined value that is less than that required to
operate the overcurrent protective device of the supply circuit.

: : Our 110 volt residential wiring consists of three insulated wires, the
: : hot (black), the neutral (white), and the safety ground (green). The

Actually, although I am not real happy about it myself, The color code
for branch circuits is as follows:

The grounded conductor of a branch circuit shall be
indentified by a continuous white or natural gray color. ...

The equipment grounding conductor of a branch circuit shall be
identified by a continuous green color... unless it is bare.

But the code still talks about grounded neutral. It appears that the
neutral is specifically the grounded conductor in a single phase, 3
wire system, "220v". An individual branch circuit does not have a
neutral, just a grounded conductor. So much for common terminology.

: : safety ground *can* be bare under certain conditions, but the other
: : two are insulated. The safety ground and the neutral lead must be
: : connected together at the distribution panel, where they're both
: : connected to Earth ground, but they aren't supposed to be connected
: : together anywhere else

This should read "at the service disconnect", distribution panels may
be located remotely, and would require four wires for a 220v feed.

: : A GFI is configured to measure current flow in this
: : third wire. If it exceeds a minimum value, it trips the hot lead
: : out of circuit.
WRONG

Alan Bloom (alanb@sr.hp.com) wrote:
: I thought that the GFI measured the differential current in the hot and
: neutral wires.

This is correct - and no grounding is required for GFCI protection. A manufacturer will probably specify a ground connection, but this for operation of the test feature. In fact, a GFCI type receptacle may be used as a replacement for existing nongrounding types where a grounding means does not exist in the receptacle enclosure - but check the manufacturers recomendations.

: If the GFI sensed ground-lead current, then if you touch a
: "hot" wire while standing on earth ground (swimming pool, for example),
: the GFI would not trip. (Since the return current would be through the
: earth, not the safety ground.)

Which, of course, is precisely what we are trying to protect against. Note that the Equipment Grounding Conductor is meant to provide a means to trip the overcurrent protection with a short circuit, instead of leaving the frame energized if an ungrounded conductor were to come in contact with the frame of an appliance.

: : Our 220 volt systems can be more complex. They can be either single
: : phase, or one of two different varieties of three phase. In residential
: : wiring single phase is normally used and all three wires usually carry
: : current. Two of the wires are "hot" and one is neutral. From either hot
: : wire to neutral, you get 110 volts. From one hot wire to the other, you
: : get 220 volts. Note the absence of a separate safety lead.

...until you get to the load side of the service disconnect, with certain *exceptions*.

: This brings up an interesting question: My (old) electric stove has a
: 3-prong 220V plug on it. It also has a 3-wire 110V AC outlet for plugging
: in your coffee pot or whatever. I assume the 110V outlet's neutral and
: safety ground leads must just be wired together to 220V neutral. Isn't
: this some kind of violation of the electrical code?

Correct presumption. No violation, this is the one exception specifically spelled out - it even has it's own section number: 250-60. Frames of Ranges and Clothes Dryers.

: : Ideally, loads are balanced so no *net* current flows in the neutral lead,
: : thus it can be considered "ground", but this rarely happens in practice.

Rarely happens? It is unlikely that it ever will - which lights are turned on? And, it can NEVER be considered ground, just 'the grounded conductor'. Remember, the white wire can be just as hot (and lethal) as any other color - depending on conditions. You should never assume that a conductor is at ground potential unless you have placed a bonding jumper to ground and tested it. Otherwise it should be treated as 'hot work'.

: I assume that's the way my stove works. There would be no reason to wire
: the burners to the third wire. For sure my linear amplifier doesn't put
: current into the third lead. What kind of 220V load would intentionally
: draw current from the neutral lead?

A 'pure' 220v load would not, but your stove is a good example, if you consider the appliance as a whole as the load - same with a clothes dryer, the motor is generally 110v.

ANARTS BULLETIN 770 01/8/93

Views expressed in this news bulletin are not necessarily those of the Broadcast Officer, the Relay Officers, or of the Society.

1993 2nd Riverina Field day

The Wagga Amateur Radio Club is hosting the 1993 2nd Riverina Field Day at Wagga Wagga on the weekend of August 14th and 15th next.

This event is to be hosted in alternate years by the above club and the Twin Cities Radio and Electronics Club at Albury, the inaugural hosts.

The event this year will be held at the Murrimbidgee Turf Club facilities with ample cover in case of rain, and carpeted indoor areas (reminds one of Wyong this year).

The event will feature Trade Displays, Fox Hunts, Amateur Television, Packet Radio, and more. Admission charge is 5 dollars per day per adult, 3 dollars concession or 8 dollars for a family. For both days, it is 10 dollars per adult, 3 dollars concession, and 12 dollars per family.

There will be a dinner on the Saturday night at 16 dollars per head with a special guest speaker, and 2 ATV videos.

There are a variety of caravan parks and motels at a range of prices, but please book in advance. Additional information may be found in the July AR.

Sounds like a good weekend's entertainment, take your foxhunting gear, and meet old friends at the Riverina Field Day, 14th-15th August.

Information courtesy of Barry VK2KUZ Field Day Co-ordinator

ANARTS meeting

The next meeting of ANARTS will be on Friday 6th August and will be held at the home of one of our members, Keith VK2ZZO. QTH is in callbook, meeting will start at 7.30 pm sharp.

Hope to see some more of our members there.

73s de Pat VK2JPA Sec.

ARRL Committee on Amateur Radio Digital Communications
Preliminary report

We are reproducing the report included in the RTTY Digital Journal of May/June 1993 and presented to the ARRL Board of Directors on March 28 1993. It should be of interest to all amateurs using digital modes on HF.
Part 7 and last

This philosophy argues for maximum " enfranchisement" of digital stations, which we use here to mean accommodating stations that want to operate manually, semi-automatically, or automatically within the digital part of the band with a minimum of restrictions.

Those restrictions that the Committee has recommended -- including regulatory subbands for auto-matic-control and bandwidth limitation of semi-automatic stations -- are intended to facilitate this enfranchisement while protecting other operations from unnecessary interfer-ence.

Maximising "throughput"

Proper use of the available spectrum also calls for maximising the amount of information that flows. The measure of this efficiency can be expressed broadly in bits-per-second-per-Hertz. That is, getting the maximum information rate in the minimum bandwidth. The Committee is vitally interested in assisting the amateur community to advance digital technology in that direction. It is the view ogf the Committee that a technology that provides 1. spectral efficiency 2. robustness, and 3. automatic channel sharing, is highly desirable. Such a technology would better serve all digital applications , automatic, semi-automatic and manual alike, by allowing all amateurs to participate in the various digital applications, while making good use of the available spectrum.

Summary

The Committee believes that the recommendations that have been developed, including the modifications encompassed in this report, provide for the necessary protection of all amateurs, a nurturing environment for the development of new technologies, the vehicle to encourage efficient use of HF spectrum, and the support necessary to properly manage the growth in traffic handled by the digital networks.
::::END::::

IPS weekly report
---
23 July - 29 July 1993
Issue no.: 31
Date of issue: 30 July 1993

Date 23 24 25 26 27 28 29

10cm 110 106 102 104 103 102 100
A 07 04 05 04 11 06 (13 estimated)
T 48 62 63 61 61 70 68

Summary of activity

Solar activity was very low or low throughout the period.

The geomagnetic field at Learmonth (WA) was quiet 23rd-26th, and 28th July, quiet to unsettled on 27th, and quiet to active on 29th.

Ionospheric F2 critical frequencies at Sydney were near normal 23rd-34th, and mostly near predicted monthly values over the remainder of the period with brief enhanced periods of up to 40 per cent on 25th-27th, and enhanced about 30 per cent at night on 28th-29th July. Spread F was observed during local night on 25th-27th, with brief sporadic E observed on 27th.

Forecast for the next week (23 - 29 July)

Solar : Low.

Geomagnetic: Unsettled to active on the 30th. Quiet to unsettled on the 31st and 1st. Mainly quiet thereafter.

Ionospheric: Near predicted monthly values.

NOTES OF INTEREST:
The AH1A Qsl cards arrived in Denver on 16 July from the
printer in Belgium. All cards should be out by the end of
September.

PRATAS Is. Bolon, BV5AF (President of CTARL) inform that he will be the Chief of BV9P Dxpedition. No definite date is fixed at the present. They are supposed to operate as BV0ARL/BV9P where BV0ARL is the call of CTARL Chinese Taipei Amateur Radio League. The island is located about 350 mile aways from Taiwan at South China Sea. Mode used will be SSB, CW, AMTOR, RTTY, SSTV and also SATELLITE with 12 operators. Stay tuned, more soon.

ANGUILLA. John, KA3DBN will be signing VP2EBN from 22 to 30 Aug. Operation will be on CW, SSB and RTTY from 80 to 6 meters.

PENGUIN Is/WALVIS Bay. James, DJ0WQ with DK2WH, DJ4LK and DJ2ZS will sign ZS0PI from 28 July till 4 August on CW, SSB and RTTY. James and DJ2ZS will than move to Walvis Bay from 6-28th August.

TUVALU Is. It appears T24JJ has concluded his stay in Tuvalu. He spotted three time on local Packet Cluster (KE6XJ area) with few rtty activity.

Send your bandpass and notes for next week to Bob, WB2CJL at CE3GDN.#STG.CHL.SA.

140. Packet on Mac: Need starting advice

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 06:11:21 UTC
From: phillips@nexus.CHapman.EDU
Message-ID: <9308030611.AA28185@nexus.chapman.edu>
Source record: 278463

Greetings, Hams!

I'm looking for advice on how to get started with Packet, using my Macintosh.
Any advice on low cost TNC's, software?

Anybody want to offload their old Mac Packet setup to get me started?

Also... I heard that somewhere on the Internet there is a repository of
Macintosh software relating to Ham Radio. Will someone please give me a
clue as to its whereabouts?

Gratefully,

\\\\\\\\\\/////////

142. Re: Emergency Power Off

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 07:04:50 UTC
From: jjast7@pitt.edu
Message-ID: <17964@blue.cis.pitt.edu>
Source record: 278470

May I summarize?

We seem to have developed four methods, each with +/-'s:

1. Safety switch. This is the 'knife blade' type, may or may not have fuses. It will clear any arcing that might weld a relay's contacts, and can be locked out. Requires power wiring (full load) to the switch enclosure. It's simplicity makes it more reliable. It can also be used to isolate everything before lightning strikes.

2. Holding relay with mushroom switch. A manual action is required to apply power to a contactor, which holds itself open, until the coil circuit is interrupted by either activation of the mushroom switch, or momentary loss of power. This can save equipment if the Utility trips something, cause we won't be live for the re-closure. The relay's contacts could weld together in case of lightning strike, or improper load for the ratings. Only control wiring is required to the switch.

3. Shunt-trip circuit breaker. A pushbutton applies A.C. power to a pigtail lead on a special circuit breaker. Probably the most common for commercial applications. You may have to dedicate a circuit breaker panel to hold it. Only control wiring is required for the switch - connections are straightforward.

4. Ground Fault Circuit Interrupter type receptacle. We either take it apart, or manufacture a cord with a resistor in series with a pushbutton between the ungrounded conductor and the equipment grounding conductor (NEC's terminology, not mine). It will work, and readily available. Definitely not U.L. listed for the intended use. I strongly recommend every shack be wired with a GFCI, but can't recommend it for this purpose.

My ideal:

Two FUSES in the house panelboard (which contains surge suppressors on the mains) to the transfer switch for the emergency generator, to a four pole safety disconnect in the shack - isolates ungrounded, grounded, and equipment grounding conductors all at once. (we don't want our gear to look like a ground potential for lightning currents). From there to a holding relay to shut us off if the utility hiccups, so we'll need a pushbutton to energize it, why not add a mushroom switch to shut-down, as well (they do look neat). From there to a distribution panelboard with GFCI breakers. Room lights straight from the house panel, of course!

Did I miss anything?

144. HAMCOM22.ZIP - HamComm 2.2: Send/Receive RTTY,CW w/o modem

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 08:28:53 UTC
From: anna@techbook.com
Message-ID: <9308030828.kp2312@tacom-emh1.army.mil>
Source record: 278472
Cross-posted to: comp.archives.msdos.announce,rec.radio.amateur.misc

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.hamradio>
HAMCOM22.ZIP HamComm 2.2: Send/Receive RTTY,CW w/o modem

HamComm version 2.2 by W. F. Schroeder DL5YEC is a ShareWare
communication program that supports reception and transmission of
amateur radio teletype and Morse code signals. Weather station
reports in the SHIP and SYNOP format can also be decoded.

A converter or modem chip is not required. The audio output of the
receiver is connected to the serial port of any PC/XT/AT compatible
computer thru a very simple and low-cost circuit. Only one IC is needed
(Op-Amp LM741 or similar) and a few diodes, capacitors and resistors.
The supply current is drawn from the serial port. For transmission the
audio signal from the speaker or serial port is connected to the
microphone input of the transmitter thru a passive R/C filter. Audio
frequency generation and decoding, serial/parallel conversion and all
other signal processing is done by the program.

Enjoy,

Tom Anna KG7NR

145. Re: Alinco 580 questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 10:13:57 UTC
From: easu348@orion.oac.uci.edu
Message-ID: <easu348.744372422@orion.oac.uci.edu>
Source record: 278474

I have one that is not completely modified. It has not been modified to RX the aircraft band. As far as I know, that is the only thing not done to it. The RX and TX ranges are the same: 130-174 MHz and 400-520 MHz. Modifying for aircraft band puts the RX down into the 110's somewhere I think (not totally sure). This is how it is on mine. Can't speak for the others out there. I just checked to make sure.

As for buying another if I had to do it all over again, I think I would choose the Yeasu equivilent, the 530. The Alinco is a terrific radio, but the Yeasu just has more features that I find are actually handy to have, such as double the memories, a voltmeter, dual-in band receive, etc. It costs about 40 dollars more around here, but if you are able to spend the extra $, I would suggest it. But, don't forget the Alinco yet. I've had mine for about eight months now, and have dropped it off of a two story building, abused it, and it has never had a single problem. I can say I really love it. So, go play with both and have fun choosing! 73's

146. Emergency Power Off.

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 10:16:51 UTC
From: P.Lucas@mail.nerc-swindon.ac.UK
Message-ID: <9308031016.AA29331@swmis>
Source record: 278473

My solution to the problem is simple; a heavy-duty (100-amp) 2-pole contactor (relay) in the feed to the shack. Its coil is wired to a recessed green push-to-make button, there is also a small extra 'sustain' contact on the relay that parallels this button and feeds power to the relay coil as long as the relay is 'in'.
In series with the relay coil is a long loop of wire, with push-to-break switches located at several places in the shack. These are colored red, and have mushroom-type heads so they can be hit easily in an emergency.

All this stuff is standard industrial/commercial electricians stock parts.

In operation, pressing the GREEN button pulls the relay in & applies power to the shack circuits. The relay is held in by the sustain contacts. If any of the RED buttons are pressed, the relay is de-energized & power is removed from the shack circuits. The other plus point about this scheme is that if the power supply itself fails, the relay drops out, and will not go back in until the green button is pressed. This stops damage thats sometimes caused when the power supply pulses on and off (which can do horrible things to equipment that has large-value smoothing capacitors, motors etc).

It also keeps shack-power off if the GFI relay undergoes a trip/reset cycle.

We have all our computer rooms wired similarly; using a series of linked relays, hitting one red button takes the clean & dirty supplies, and the lighting, all out in a single action, and requires human intervention to start anything up again.

>by passing line and neutral conductors through a toroidal transformer
>core; these become two (common-mode) single turn primaries. The
>secondary coil (many turns around the toroid) trips a breaker if the
>difference of the hot and neutral current is greater than ~5mA.
>

Both types exist in the UK - the type that measure ground current are
called ELCBs (Earth Leakage Circuit Breakers) and are now deprecated
for exactly the reasons mentioned in this thread. The current-imbalance
type are called RCDs (Residual Current Devices).

However (and this is where this followup is mildly relevant), the term
ELCB is now widely understood to mean 'a device that cuts off the power
when there's a fault that doesn't blow a fuse' and so is wrongly used
to describe both types.
The result is similar confusion to that shown by posters in this thread
regarding the mechanism used by GFIs.

151. WB1GOF back on the air!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 12:44:38 UTC
From: tstader@aol.COM
Message-ID: <9308030844.tn61266@aol.com>
Source record: 278352

Due to a combination of equipment failure and vacation schedules, the WB1GOF station on 146.52 MHz was off the air for the past two weeks. The problem has been resolved and the * tone-decoder has been restored.

The WB1GOF station has been serving the needs of the mobile amatuer radio operator in northeastern Massachusetts continously since 1978 and it's supporting organization, The Police Amatuer Radio Team of Westford, is committed to keeping the station on the air for emergency communications requirements.

Below is the procedure for accessing WB1GOF. Please pass this information freely so that hams that traverse our area will be in immediate contact with emergency services when needed.

PART also provides emergency autopatch capabilities via the WB1GOF repeater on 442.450 MHz. If you are interested in those details, please feel free to contact the originator of this message. This repeater has coverage throughout eastern and central Massachusetts, southern New Hampshire and northern Rhode Island.

---------------cut her
e---------------------

WB1GOF - *146.52

You've seen the blue signs on the highways in and around northern Massachusetts... what do they mean? WB1GOF is a cooperative service (and the club call) provided by the Police Amateur Radio Team (PART) of Westford, Massachusetts and the Westford Police Department. This station is available to all hams who commute within the stations receiving area on the simp
lex frequency of 146.52 MHz.

Accessing WB1GOF is simple.....
- Using the Touch-Tonex en
coder on your rig, press the * for 2 to 3 seconds and then call WB1GOF followed by your call.
- Some
one will then answer your call.
- Give precise information, not glorified by all the "gory"
details.
- If you are not able to give a mile marker or exit number, give the closest land mark a
nd direction of travel.
It will sound like this:
KA8SCP: * (tone for 3 seconds) "WB1GOF this is KA8
SCP"

WB1GOF: "This is WB1GOF, go ahead with your emergency message."
KA8SCP: "Reporting a 2 car accident, with injuries, 495 northbound at Exit
32, Boston Road just after the the exit ram
p."
WB1GOF: "Roger, accident with injuries, 495 north at Boston Road just after
the exit ram
p. We'll send a cruiser (or "State Police will be notified") right away.
WB1GOF out."
Make sure to keep your transmission as brief and yet precise as possible.
WB1GOF may request that you rep
eat your call sign. Please repeat your call using "standard" phonetics! Not
the "cute" ones!

hideg@spsd10b.erim.org ([Steve Hideg]) writes:

|Regarding the weights -vs- length discussion:

|My understanding of physics is that additional weight does not affect the
|perioud of a pendulum. Pendulum *LENGTH* changes the period.

It's a different kind of pendulum. In gravity pendulums (such as
found in clocks) as the weight's mass is increase so does the force
due to gravity and the acceleration stays the same. (Gravitational
acceleration is constant, at a given fixed location.)

In a bug the force is constant (determined by the shape and material
of the spring(s), so the acceleration of the pendulum is inversely
proportional to the mass of the weight.

wjturner@IASTATE.EDU (William J Turner) asked...

>Who out there in netland knows what to use AS for?

I send AS when I have to pause ("wait") for a few seconds. For example, I
was fixed mobile, engaged in a QSO and had to move frequency. My mobile
antenna is _very_ narrow on 40m, so I hd to run outside and adjust it.
I suppose AS would be good when I dropped my pencil, it rolled under the
desk, and I had to crawl around for it. :-)

then CSMSCST@MVS.OAC.UCLA.EDU (Chris Thomas AA6SQ) commented...

>I've found AS to be an effective response when someone sends QRL?
>right on top of the weak DX station one is trying to work... It's
>shorter than most of the alternatives (and less profane than some
>that come to mind.)

The standard responses to QRL? taught to me by a 100 percent CW op
are "YES" or "C", but I suppose AS gets the point across nicely, too.

|>
|> 73,
|> Eric
--
After the mod, the RX is now 108-174, 400-487 and 860-999. It will display
up to 519 and down to 810 but the PLL will not lock. I don't know what the
xmit limits are since I haven't received my ticket yet and I have no dummy
load to test out-of-band.

If I could have afforded it, I would have bought the W2A - although I do like
my 580. The downsides of the 580 are a very sloooow scan rate of 2 ch/sec and
only 40 memories. I guess 40 memories wouldn't be bad for scanning only
amateur frequencies, but I sold my handheld scanner to buy the 580 so I
expect it to serve as a public service scanner as well. The factory duck
makes a good dummy load, so you should plan on buying a real duck such as
the ANLI 800 or dual-band Anderson Kulduckie. This is true of many HT's
from what I've seen/heard.

You should also look seriously at the Standard 558 and the Yaesu 530 - people
swear by them more than at them. I've heard that the Kenwood TH-78A has
intermod problems - but perhaps they've reduced this as Alinco has in later
copies of the 580. Please post your decision here and summarize your
evaluation of your new HT - it will help others...

levin@bbn.com recently asked...

>Why would anyone ever start their transmission with "BK"?

I asked this too when I got into CW in a serious way. Here's the explanation I got... The two ops in a QSO will use BK as a quick way of going back and forth during the QSO. Rather than sending something like "KD1ON DE WO1G K" or just "DE WO1G K", WO1G would end with "BK" to say "over to you". KD1ON would then send "BK" at the beginning of his transmission so that WO1G would be sure to know which CW signal in his receiver's passband really is KD1ON.

Does anyone use a "Flytecraft" 40-15 vertical antenna? I'm considering
buying one to supplement my R5 20-10 vertical in lieu of buying an R7.

Any comments at all would be appreciated.

Thanks,

Randy Padawer

>station has received no other calls. Is it ok for you now to reply to the
>caller, or should I QSY to a nearby clear spot and call? That is, does the
>frequency come "up-for-grabs" at exchange of SK?

I agree that the frequency is "his". If it were say, VK3XU, calling me,
this is how I would handle it. I would very quickly tune a bit up or down to
find an area that seemed pretty clear. (I'd take advantage of the two VFOs
on my rig to be able to get back to where I was.) Note that "seemed" is the
best I could do on such short notice. Let's say that around 5 kHz up seemed
clear. I'd go back to the freq I was on and send "VK3XU UP 5" then go up 5
and send "QRL?". Even if the up 5 freq was in use, I'd figure I could find
something pretty close that was clear and then call VK3XU. Of course, I
haven't settled the issue of who calls whom, but that could be solved by
using "QRX" initially or just making short calls and listening for the
other station to call or answer.

If that's the real McCoy, then we've been told a lie by _someone_

This version makes NO MENTION of increased scope of operations by ARES/RACES type operators at Public Service events. The whole purpose of the rulemaking was supposedly to allow for a codified sanction of the types of traffic we're carrying now ("Startline to NCS, we're out of T-Shirts here", "Rest 3 to NCS, the officials here would like some more blah blah blah", etc...)

Also, it was supposed to have some wording that would have made AMPR.NET to other network gateways plausible. Not to mention PIZZA

What's the dope, man?

You are correct. The GFI uses a balanced transformer to sense differences
in current flow between hot and neutral. They're set to trip with a 5 ma
difference. As you note, the fault current doesn't have to flow through
the safety ground wire, though it will in most equipment faults, hopefully
before you touch it. I stated it's action incorrectly above.

>: Our 220 volt systems can be more complex. They can be either single

It's permitted under 250-60 of the NEC.

"Frames of electric ranges, wall-mounted ovens, counter-mounted cooking
units, clothes dryers, and outlet or junction boxes that are part of
the circuit for these appliances shall be grounded in the manner specified
by Section 250-57 or 250-59; [a wired safety ground -GC] or, except for
mobile homes and recreational vehicles, shall be permitted to be grounded
to the grounded circuit conductor [neutral -GC] if all of the conditions
indicated in (a) through (d) below are met.

(a) The supply circuit is 120/240 volt, single phase, 3-wire.....

(b) The grounded conductor is not smaller than No. 10 copper or No. 8
aluminum.
(c) The grounded conductor is insulated.....
(d) Grounding contacts of receptacles furnished as part of the equipment
are bonded to the equipment."

>: Ideally, loads are balanced so no *net* current flows in the neutral lead,
>: thus it can be considered "ground", but this rarely happens in practice.
>
>I assume that's the way my stove works. There would be no reason to wire
>the burners to the third wire. For sure my linear amplifier doesn't put
>current into the third lead. What kind of 220V load would intentionally
>draw current from the neutral lead?

The clock in your stove does. It taps 110 volts by going across one
hot and neutral. Any appliance, like a hand mixer, that you plug into
the stove outlets also causes imbalance. In circuits where mixed 110
and 220 voltages are required, load imbalances are common, and unavoidable.
In circuits with pure 220 volt loads, there should be no imbalance. It
can happen with certain industrial motor controllers, however, but shouldn't
ever occur when the equipment is transformer isolated. Imbalances are
almost always found in distribution systems where 110 and 220 loads are
tapped off the 3-wire system. It's practically impossible to maintain
balance when there are switched 110 volt loads in the system.

The recommendation for the AEA hot-rod is a good one. I've hit repeaters a
hundred miles away on two watts while in Big Bend National Park. And while
up on Guadalupe Peak (highest spot in Texas) I hit repeaters in El Paso on
half a watt with a Cushcraft 4 element beam. Height and antenna are the
most critical things.

Steve is right, the additional weight does not affect the period of a pendulum. BUT, as i remember from my physics days, a pendulum is suspended from a point and is free to move in a gravitational field.

this is not the case for a bug, thus the weight does make a difference because of a spring constant and the inertia of the weight added to the arm. try this. take bug and send a string of dits. add a clothes pin to the arm at the same point at the current weight. does the speed of the dits change? i thought so. EOT

dit dit

Cross-posted to: rec.radio.amateur.misc,alt.radio.scanner

As a service to the net-aware ham community, we have created an
anonymous ftp site to hold modification instructions for ham radios
and scanners, the use of which result in extended RX (and
possibly TX) ranges, and/or other "interesting" features.

We are unaware of any site which offers such a service at this time.
If informed otherwise, we shall actively seek out their entire
collection(s), and add it to ours.

So... If you have any mods (which you would like added to what we
hope will become THE Internet Modification Archive), please, deposit them
via anonymous ftp in:

ham.eetech.mcgill.ca:/incoming,

or if you don't have ftp access, they can be mailed to:

ham@eetech.mcgill.ca.

At the moment, we have around 100 mods, which are located in:
ham.eetech.mcgill.ca:/pub/ham-radio/mods.

: Of course all exterior cabling should be shielded,

Very true. Check out the easy stuff first. When I brought home my new PC and SVGA it trashed out several bands. I was using a extender cable on the video. I removed the extender cable and the problem was gone.

Why do you want to duplicate the other ftp sites?

I am interested in purchasing a used ICOM IC-28A. While checking the features of the radio owned by a friend, I see that the tone squelch can only be activated in the simplex mode, not in the duplex(repeater) mode. This limits the usefullness of the rig for my application. Anyone know of a simple modification to allow tone squelch in the duplex mode.
TNX.
Please respond to me at whamt!wrw

You apparently don't see the big difference here!

To paraphrase the new 97.113 (I haven't commited it to memory yet ;-)
unless you are DIRECTLY employed by the sponsor, i.e. this is the way
you make a living, then the communication on behalf of he sponsor to
deal with logistics, et al is just fine.l

This is a radical improvement from point of view. As an OO I had to use
a pretty black and white/conservative definition of what was allowed when
discussing "business" communications with other amateurs. Now things are
ALOT simpler/easier to understand.

You have to compare this with the "old" 97.113. The key is what's gone -- there is no longer language that prohibits amateurs from providing communications if they could have been provided by other services, or if the the business interests of any party are advanced. The FCC's NPRM text specifically mentions that the objective of deleting that language was to allow greater public service participation, as well as permit amateurs to conduct some (non-regular) personal business on the air. Ordering food, transportation, lodging, and supplies was specifically mentioned in the NPRM as now being allowed. With the exception of the use of the slippery word "regular", the new 97.113 is much improved over the old version.

>Why do you want to duplicate the other ftp sites?

I was about to ask the same question, but Bob beat me to it.
Duplication is not necessarily bad (mirroring assures redundancy in case of site failure, and allows one to retrieve the data from the closest site). However, duplication of effort without coordinating with other existing efforts is undesirable. I can't stop you, of course, but you should be aware of other existing efforts to archive mods and their successes and pitfalls.

If you read my "Index to the rec.radio.amateur.* Supplemental Archives" (check rec.radio.info, news.answers, ftp to rtfm.mit.edu and get the file /pub/usenet/news.answers/radio/ham-radio/archives, or send E-mail to mail-server@rtfm.mit.edu and put "send usenet/news.answers/radio/ham-radio/archives" in the body), you'll notice quite a number of ftp and archive sites, many of which have mods directories.

The FAQ (replace "archives" with "faq/part2" in the above directions) also has mods site info. Mods are also posted to rec.radio.info (and usually cross-posted to rec.radio.amateur.equipment, with followups directed there), and archived at the various rec.radio.info archives (Check the informational posts on rec.radio.info for more information).

So, there are plenty of archive sites and forums for mods. What is missing is a lot of submitted mods (as these are all voluntarily maintained), and much verification of whether they are correct or not (a recent April-Fools joke about how to modify the Realistic HTX-202 was not only incorrect, but unknowing owners could have damaged their radio trying to apply it).

Again, take this all under consideration, and proceed as you wish. I like volunteerism on the net and try to encourage it in any way I can, provided it's reasonably coordinated and doesn't substantially duplicate existing effort. On that note (one more blatant plug, and I'll leave the net alone :-), anyone interested in making coordinated, voluntary contributions to this newsgroup and its associated informational

postings and archives, is welcome to join the rra-wg (rec.radio.amateur Working Group) mailing list. Feel free to introduce yourself, describe your projects, or just lurk. To subscribe, send E-mail to rra-wg-request@amdahl.com.

178. Emergency Power Off

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 17:18:56 UTC
From: taylor@tix.timeplex.COM
Message-ID: <9308031718.AA04674@tix.timeplex.com>
Source record: 278350

Just to set the record straight, electrical services in the US in residential areas are 240/120 volt single phase as defined by the REA and ANSI (not 220/110 which is a fifty year old standard and obsolete).

One ham in Montclair NJ recently had problems with his linear amp not putting out full rated power. I went over to measure the 240 volt line and measured 199 volts !. Then I measured 113 v.a.c. from each hot lead to neutral...hmmmm. After contacting PSE&G Co., I found out that they have so called 208 service in that residential area, e.g. 2 phases of a three phase system. The reason they did this was to save duplicity of installing single phase and three phase distribution in a mixed business and residential area where there are 208 "Y" 3 phase customers. We subsequently installed a buck/boost auto-transformer in the shack wired to boost the 199 volts. Now he has 235 volts under load and the amplifier is happy.

Back to the discussion of others, per NEC NFPA-70 (1993) article 230-2, only *ONE* service entrance is permitted in a single family dwelling and per article 250-22 grounding is required for a service at the panel where the main disconnecting means. Also, on branch circuits the neutral *cannot* be used as a ground, except for electric ranges and ovens. This is because the lines to ovens and ranges are a direct run to the panel(s) where neutral grounding is derived. Where the supply cable attaches to the electric range, that point becomes an "extension" of the service entrance panel bus (article 250-60). The code permits the use of SE type cable (usually a 50 or 60 amp. rated service entrance cable) for electric ranges. In fact, this is one of the few places where the code permits the use of SE cable for inside wiring. It's usually only permitted for service entrance purposes (article 250-60 fig. 250-20). Article 338-3 cover exceptions and limited use of SE and USE cables.

On branch 120 va.c. branch circuits the neutral can be several volts above ground depending on load characteristics. The ground, whether it's the metal conduit or the bare wire in NM (romex) cable is there for safety only and intended to carry fault currents only. Ideally, the current flow in the grounds in all the household branch circuits should have no potential on them at all except for small leakage current induced voltages.

-on luggage, and I was wondering if there were any problems with doing this.
-I realize that they will probably shoot you if you start transmitting or
-such while on the plane, but I would like to know if airport security will
-let you on the plane with it in carry on luggage.

I have never had any problem with this. They will ask you to turn it on
to prove it is a radio; I always just tune it to the local NOAA weather
freq before entering the terminal, but probably just opening the squelch
will be enough. I usually just pass it to the guard along with my keys
and spare change. Just make sure you have a charged battery on the HT.

One security guard asked me to demo a portable packet station, but since
he was also asking for the times and locations of local VE sessions, I
guess the interest wasn't security related :-)

As for using it on the plane, if the stewardess won't shoot you,
rec.radio.amateur.misc readers will !!!

-Also, can you transmit from within an airline terminal, or is there a
-chance that you will be causing harmful interference to anyone? Also,
-will they let you do it? Any replies will be appreciated.

I have operated from within the terminal without any problem, however
I did set off one of those walk-thru metal detectors once. Moving ten
feet away solved that problem. I would recommend using an earphone to
avoid disturbing anyone (and hopefully you can plug it into the armrest
on the plane and spare your ears from the torture of the plastic
pneumatic 'phones).

I understand the distinction, I was *looking* for a policeman.

: That does NOT mean we go around playing radio cop.

Nor should ordinary citizens play cop. That doesn't mean that they shouldn't call 9-1-1 when they think they see a crime in progress. The police (FCC or otherwise) can't be everywhere, so they depend on reports from the public to let them know what they're missing.

: - Brian

Assume that she had a reciprocal license from a foreign country. Or, if you'd like, assume that she lied to the man at the exam desk and she really does have a valid license. Would the FCC just walk up to her and arrest her? I suspect that they would ask to see her license before they considered any sort of legal action. That would seem to be the most prudent thing to do. I wouldn't expect a policeman to arrest me for driving without a valid license until after he has asked to see my license, either.

>you may run three wire 220 (hot1-hot2-gnd) ONLY if the appliance has
>no 110 volt circuits; hence Al's stove is a flagrant violation...
>presumably the code was a bit more lenient once upon a time. Many
>electric clothes dryers are hooked up this way with 3 prong plugs.

Well, NEC disagrees with you. Article 250-60 says:

"Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and _outlet_or_junction_boxes_ which are part of the circuit for these appliances shall be grounded in the manner specified by Section 250-57 or 250-59; or, except for mobile homes and recreational vehicles, shall be permitted to be grounded to the _grounded_circuit_conductor_ if all of the conditions indicated in (a) through (d) below are met.

(a) The supply circuit is 120/240-volt single phase, 3-wire; or 208Y/120 volt derived from 3-phase, 4-wire, wye-connected system.

(b) The grounded conductor is not smaller than No. 10 copper or No. 8 aluminum.

(c) The grounded conductor is insulated; or the grounded conductor is uninsulated and part of Type SE service-entrance cable and the branch circuit originates at the service equipment.

(d) Grounding contacts of recepticals furnished as part of the equipment are bonded to the equipment."

So you see, NEC says it is OK to connect the frame of your stove to the "grounded circuit conductor" (the neutral wire for 220), and to connect 115v recepticals between the "grounded circuit conductor" and a hot lead, so long as the receptical's grounding contact is grounded to the frame of the stove.

Always best to go to the source.

To All:
I recently bought a RS HTX-202 2m HT, and have been less than satisfied. It experiences some sort of birdie sounds on several of the local repeater frequencies, and can't seem to stay on stations that it picks up during scanning (probably related to the fact that I have to keep the squelch tight to overcome the birdies)
Between the other <$300 HT's available (ie ICOM IC-P2AT, IC-02AT, IC-2iA, IC-2SAT, Kenwood TH-27A, and the Alinco DJ-F1T), can anyone provide some recommendations for which one(s) to consider? I think I'll hold on the the HTX-202 until the 30 day return period is up, return it, and get another unit. Thanks for any comments in advance!

OK, I'll buy that. Seems that the anecdotal information is left in the NPRM.
Does anyone have the NPRM that was ruled upon to change 97.113? Since the
FCC didn't choose to put anecdotal information in the rules (good idea IMHO)
I'd like _some_ guidelines/interpretations...

Any copies of the NPRM?

: When I worked August (ES1WN), he gave "Box 1649 Tallinn"
: as his QSL address.

I logged him as ES1WW. Has anybody gotten a card back yet?

|THERE you have it! First Things First at the ARRL,
|The Association for Retarding Radio Licensing!

Under the rules by which VECs are allowed to exist, the ARRL VEC organization is somewhat separated from the ARRL, at least as far as day-to-day operations are concerned.

It is unlikely that the effort the DXCC people put into catching up on their backlog had any effect on the VEC operation.

The main problem remains the length of time applications take to go through the FCC office in Gettysburg.

Bruno-

There are quite a few such sites. It isn't unusual to find a "mods" subdirectory at an ftp site with Ham files. They all seem to have the same basic collection of mods. These same files are also found on several packet radio "mods servers".

One site you should check out: atlas.eetech.mcgill.ca, in the directory, /pub/ham-radio/mods.

191. Re: Emergency Power Off

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 18:39:43 UTC
From: brian@nothing.ucsd.edu
Message-ID: <23mbdfINNqpt@network.ucsd.edu>
Source record: 278361

As a minor point, we have followed a rule of thumb in our computer rooms and other technical areas that the neutral shouldn't show more than a volt above ground under normal load, at frequencies below 100 kHz.

In a few cases where we did find higher neutral-to-ground voltages, fixing corroded joints, tightening screws, and other typical mechanical fixes cured the problem - and at the same time, the frequency of "flakey system crashes" was reduced significantly.

I recall that there is one exception to the rule that neutral is tied to the grounding conductor only at the service entrance, and that is at the secondary of a permanently-installed isolation transformer. The primary is connected to the mains hot(s) and neutral, the frame is connected to the safety ground - or a better ground, if available. The secondary starts the grounding over again with neutral and ground tied together again. In residential service, of course, such isolaters are rare - but not unknown.

193. Need remote control info on ICOM IC-720A

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 19:34:40 UTC
From: dfeldman@teal.csn.org
Message-ID: <CB77pt.4vC@csn.org>
Source record: 278368

Do you have the specs on the remote interface to an ICOM IC-720A?
The physical interface is a 4-bit data bus (CMOS) and a few control
signals.

Alternatively, do you have a remote controller you wish to part with?

73 Dave WB0GAZ dfeldman@teal.csn.org (Colorado).

What to do if the man next door uses a pc and a plastic atari in the atic,
next to my beam???

The atari could not stand a lot of hf (hi), but the pc remains a problem,
i cannot get near to it, and if that could be, I am of course the reason
of the next software/hardware problem.

....Robert, PA2JOB.

Just in case you don't have the Handbook here is response I saw to the same question. from Christopher Owens ?

To get the great circle distance between two points on the earth's surface: first convert latitude, longitude to x,y,z coordinates, then find the straight-line distance between the two, and then find the length of the subtending arc.

x = cos(lat)*cos(lon)
y = cos(lat)*sin(lon)
z = sin(lat)

Straight-line distance between points is
dist=sqrt((x1-x2)^2+(y1-y2)^2+(z1-z2)^2)

Length of subtending arc is D * asin(dist/2)
where D = the earth's diameter, 12765 km

> what is the better answer.)
>
I was thinking about exactly this just after Chuck posted his article that started this thread. I think a DSP could be used to implement this in the following way. The first step (apart from some decimation/interpolation) would be a standard CW passband filter (e.g. 500Hz wide centred on 800Hz). The output of that filter goes into two separate filters - a low pass and a high pass which are designed to give -6dB attenuation at the centre frequency. The low pass output then eventually ends up in the left channel and the high pass to the right channel.
I believe that the characteristic of -6dB attenuation at the centre will give what is referred to as a half band filter. This has the advantage that almost half of the filter coefficients will be zero, thereby reducing the amount of computation required for the filters and allowing, if necessary, for filters with more taps (which gives increased stopband attenuation).
This type of filter (FIR) has linear phase characteristics so if a 180 degree phase shift is still required, it can either be written into the program or hardwired into the headset.

>: That does NOT mean we go around playing radio cop.
>
>Nor should ordinary citizens play cop. That doesn't mean that they
>shouldn't call 9-1-1 when they think they see a crime in progress.
>The police (FCC or otherwise) can't be everywhere, so they depend on
>reports from the public to let them know what they're missing.

This raises an interesting point (at least for me). The question is whether a citizen has police powers.

First of all, it should be pointed out that the existance of police forces are a relatively recent phenomenon. During the founding of the US, problems were dealt with by the militia (defined as being all males between 18 and 45). When there was a problem (criminal or otherwise), ordinary citizens would be gathered to combat the problem. I believe that early police forces were unarmed people whose purpose was to keep and eye out for trouble and to gather help from the armed citizenry should the need arise. Over the years, the powers and privileges of the police has grown while the rights of the citizenry has been slowly stripped away.

There is also the concept of citizen's arrest (which exists to this day). The difference between citizen's arrest and a police arrest is that the police is not responsible for their actions while a citizen is. [This is NOT a comfortable feeling for me since this allows the police the license to play Rambo. Note the recent court decision in NJ which allows the police to kill citizens with impunity when in pursuit of a criminal.]

Furthermore, court precedents have clearly shown that the police is NOT required to render assistance when the citizenry needs it. In other words, the police is not required to do anything when 911 is called. Thus, there is a need for ordinary citizens to have the means to protect themselves from criminal elements.

Thus, on a theoretical level and for hazardous circumstances (e.g. rape, murder, etc.) it is important for citizens to have the ability and the right to act as police.

With respect to something as trivial as a bootlegger, I would have to agree that it would be far better to leave it to those who we designate to handle the problem in our name. [Note that I am not saying that we do not have the power or the right to do something but that we have allowed another party the privilege to do it for us.] The liability problems of being wrong is significant. [see my third paragraph] and is probably more trouble than it is worth.

Because there doesn't appear to be a centralized, and organized
location for such information. Doing spread-spectrum with archives is
messy.

Which ftp sites are you referring to?

201. 6 ghz cellular is under test in Boston.

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 20:57:39 UTC
From: die@pig.UUCP
Message-ID: <1200@pig.UUCP>
Source record: 278375
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,alt.radio.scanner

AT&T apparently has a 6 ghz cellular personal communications system under test in the Boston metropolitan area. About a year ago they put up a strange new tower along route 128 on Bear Hill in Waltham Mass, at a former TD-2 4 ghz microwave site once used as a video spur route for relaying the broadcast TV networks into Boston; the site is located on a hill that overlooks much of the Boston skyline and the western suburbs of Boston. Today I was able to find out that the tower, and a similar one in Boston itself, are being used as part of an alpha test of a 6 ghz hand held personal communications system by Bell Labs. Boston is apparently the first site in the country in which this system is being tested.

The 300 foot tall tower has a platform at the top with 9 rectangular antennas arranged in a semicircle to provide 180 degree coverage pointed in an arc facing east toward Boston and route 128 to the north and south. Each antenna seems to be intended to serve about 20 degrees of azimuth, and seems to be pointed downward at about -10 degrees or so elevation. Each of the antennas is fed with 6 ghz circular waveguide with an apparent transition to rectangular guides at the base of the tower. The antennas themselves appear to be about 4 feet wide by perhaps 12 feet tall and to consist of a thin slice of a parabola oriented in the vertical plane with a multihorn feed in front. This would suggest a fairly broad pattern in azimuth (perhaps as much as 20 degrees) with an electronically steered beam in elevation.

The tower has a single 10 foot dish pointed at the horizon north toward the North Andover Bell Labs (one of the primary Bell Labs microwave equipment development facilities) test facility about 20 miles to the north of Bear Hill. And while the west facing 4 ghz dishes have been removed, the 4 ghz dishes facing east toward Boston have not, suggesting that the 4 ghz link may be in use to connect to the Boston 6 ghz site.

I am told that the tower is being used to communicate with hand held transceivers (cellphones) at 6 ghz and that each antenna is supported by one "transmitter". This would imply some sort of spot beam TDMA system with each transciever getting bursts at its elevation and 20 degree azimuth slot.

Apparently the system is in use by lab staffers and works well enough to be tested more extensively. I was not able to find out if the 6 ghz signals penatrated buildings at all or how the multipath issues have been dealt with or what exactly the bit rate or other modulation characterstics are. But it does appear that AT&T 6 ghz PCS systems are real enough for such a test bed to be built.

It will certainly be interesting to look at what is coming out of
the antennas on a spectrum analyzer. And looking in time domain mode
may also be interesting as it should be possible to see the beam step
from transceiver to transceiver.

CALL FOR VOTES (2nd of 3)

Unmoderated group rec.radio.scanner.

Newsgroups line: "Utility" broadcasting traffic above 30 MHz

Votes must be recieved by Tuesday, Aug 24, 1993 11:59:59 GMT.

This vote is being conducted by a neutral third party. For voting questions, contact rdippold@qualcomm.com. For questions about the proposed group, contact Risto Kotalampi (rko@cs.tut.fi).

CHARTER

rec.radio.scanner is a newsgroup for discussion about "utility" traffic above 30 MHz. FM & TV-broadcasting, shortwave, amateur radio and broadcast satellite-related material doesn't belong to rec.radio.scanner because they have their own newsgroups. This newsgroup replaces alt.radio.scanner. In addition, the rec.radio.scanner will be gatewayed to a mailing list which will be created as soon as possible after newsgroup creation, as there are many who do not have access to USENET news.

---------- Standard Voting Info ----------
You should send MAIL (posts to a group are invalid) to voting@qualcomm.com
(just replying by MAIL to this message should work). Your mail message should contain one and only one of the following statements:

I vote YES on rec.radio.scanner
or
I vote NO on rec.radio.scanner

You may add a comment, but anything other than a definite statement involving the group name and "yes", "no", "for", or "against" on a single line may be rejected by the automatic vote counting program. If you later change your mind you may also use send in an "abstain" vote in the same manner, using "abstain" in place of "yes" or "no". There will be two additional calls for votes including mass acks.

Standard Guidelines for voting apply.

We at ARRL HQ are very proud and appreciative of all the time Luck Hurder, KY1T, spends online on a number of services, posting bulletins and informational messages, and providing users with an easy way to request materials and information resources direct from ARRL HQ.

Keep in mind that anyone who wants information about how to get started in Amateur Radio, how to work with children (in schools, Scouts or otherwise), how to recruit new prospects for ham class; or information on space shuttle ham radio operation, can send a message via Internet to Bob Inderbitzen, NQ1R, of the ARRL Educational Activities Dept (EAD). His address is:

binderbi@arrl.org

You probably wouldn't believe the amount and range of free materials available from ARRL HQ just for the asking! (Another reason to join and support the League.)

>Exactly what was the offense here? As I read the rules you are required to
>identify every 10 minutes and at the end of transmission. (IE not at the
>beginning.) So what was the problem?

Well you see, in those days you had to identify both your station and the
station(s) you are in contact with at the BEGINNING and END of your QSO
as well as every 10 minutes should you be so full of it. AND you had to
keep a written log of everything, date, time, freq, station, etc. for
at least a year. AND you had to have a CONELRAD receiver on all the time
you were operating just in case the Ruskies might use your station as a
homing signal. I had to do all this stuff once except the CONELRAD.
Don't tell me some things haven't gotten better. Now if we could just lighten
up on the 10 minute rule and get people to stop sending so many callsigns.
I know mine. That's all I need.

208. Automatic Packet Reporting System

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 22:32:04 UTC
From: raymonda@uranium.EBay.Sun.COM
Message-ID: <23mp14$ot6@male.EBay.Sun.COM>
Source record: 278379

There have been a couple articles over the past 2 months in QST
that concerned the Automatic Packet Reporting System. The APRS allows one
to connect the NMEA-0183 output of a LORAN-C or GPS receiver to a packet
system such that the location of the packet station is constantly reported
to a remote location where the location is displayed in real-time on a map.

The article (don't have the reference handy at the moment) gave a
name and address to obtain the software (shareware). It also stated that it
was available on several non-specified BBS systems. Does anyone know if it
is available via FTP on the net? I've checked most of the FTP servers that
carry HAM related info that I know about, but so far haven't found it.

Thanks,
Ray WB6TPU

If you fly and choose to put your HT in your checked luggage, better check the airline's policy on what they will replace if your luggage gets lost..."personal electronics" are usually excluded...

How do I know this? Because I sweated out a couple of weeks while I waited for an airline to find my suitcase, that I had two ICOM HTs in...they found it eventually, but from then on, after finding out about the policy, I carry on all "personal electronics".

213. Quad Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-03 23:37:48 UTC
From: UD173191@NDSUVM1.BITNET
Message-ID: <93215.183748UD173191@NDSUVM1.BITNET>
Source record: 278389

Well, this weekend I won the local foxhunt, and I'm thinking of building a 2m quad for better DF'ing. I'm thinking about a four-element, with 2 directors and one reflector, although I may eventually expand upon this. I understand that the directors are smaller (by 5%? I don't have my figures with me now...) and the reflector is larger than the DE, but are all directors the same size? Or is each director out from the DE 5% smaller than the preceding one? The only formula I have to compute with is the one from the ARRL General Class book, and they only list figures for a 3-element quad. I'll be making it out of PVC pipe with hardwood dowels for spreaders and 1/8" cable for the elements (tentatively). Any additional advice is appreciated.

Radio Shack does indeed sell a plug that will fit the non-standard
Yaesu 530 DC Jack. It costs $2.49 and is part number 270-1575. It
has a brown colored tip. It also fits Sony portable CD players which
have the same non-standard jack.

Hope this helps,

FredE

From: uznerk@mcl.ucsb.edu
Message-ID: <23muji$mg6@hub.ucsb.edu>
Source record: 278386

I'm in the market for a HT pretty soon, and was wondering if there was
any particular place out there which offers very good prices or service.
Particularly, I'm interested in either getting an Alinco DJ-580 or a
Yaesu FT-530. I understand the Yaesu is a better radio at a higher price,
but right now I'd say that I'd probably buy whichever one I can get a
better deal on. Any advice would be appreciated..

well, as indicated by seing the same questions over and over the past few weeks, either the existing sites are inadequite, no one knows about them, or the data is scattered over so many sites, it's too hard to find.

I'm all for a single FTP site and/or a single FAQ, which has all the scanner model quesitons, reviews and mods, and all frequencies that get osted here from time to time...

>73 de Pete hardie@herald.usask.ca VE5VA

This is off to a good start, but I think we should
stay away from implemetation issues until after
we have an idea of what transformations would ease
cw copy. What if we begin with a realtively wide
bandwidth, e.g. 3 KHz. Then, break up the passband
(maybe even at the IF, but again, lets leave the
implementation until later) into a range of frequencies.
We phase shift each frequency component so that
high frequency sources come from the left hand
side of the room, mid frequency sources (near the
center freq of the tuning dial) appear to eminate
from straight ahead, and low frequency sources

sound like they are originating from the right hand
side of the room. Then, we compress the audio
frequencies (I have not thought about how to do this yet)
so that insted of listening to tones from 0 Hz to 3 KHz,
all the cw tones are from, say 800 Hz to 1500 Hz.
Now, the tones will all be copyable and your brain
can use location in space rather than pitch as
the primary cue for selection a station to listen to.

Thanks John! I was beginning to wonder whether anyone was interested
at all... I am not opposed to becoming "the" site for radio and
scanner mods. If the FAQ maintainer wishes to place our site in the
FAQ, that's fine with us -- but his reply to my original posting
didn't strike me as too enthused.

Our logs show that we have received over 80 ftp connections for the
mods today. So far, I've accumulated a little over 200 mods, although
I must confess that noone has yet sent me anything.

I have taken a walk through all the ftp sites mentioned in the faq,
and have made a union of what I found.

Finally, we would like to ask archive users to please take what they
need, and not too much more, as we're at the far end of a rather slow
link, which is used for other things.

Maybe a quick and dirty way to try the earphone phasing experiment is to get one of those stereo "hi-fi" "graphic equalizer" boxes, and a small stereo amp with a headphone jack. Connect the audio output from the rig to both inputs of the graphic equalizer (L,R). The outputs of this box feed the stereo amp, and connect the ear/head-phones to that. Adjust the controls of the equalizer to get the lower freqs (100-300Hz) to the left (by boosting the lows on the left, cutting the lows on the right channel), some equal gain for say 300-600Hz, and boost the stuff above 600Hz on the right channel, and cutting same on the left. This should give a spatial effect like what this thread is discussing.

It's probably not worth buying the above gadgets new to do this, but you may already have this stuff in the stereo system in the living room, and swipe it to try this test. If nothing else, to get a better idea on what specs the DSP design should go for.

The Phone company's got your number!

I have taken my HT on the airplane in my carry on bag. I have heard
others transmitting from a terminal but have not done so myself.

>>>You're right, it's not right! :-)

>>>A dBm is simply decibel's referenced to 1 milliwatt.
>>>There is no impedance specified, or implied.

You're right, dbm does not mean any particular impedance in itself.
Relating the dbm power reference in voltage requires stating an impedance.
Somewhere along the line the S-scale we use assumes a 50 ohm impedance,
as thats the only way you can equate S9 to 50uv and -73dbm. In a 50 ohm
system 0dbm=223.5mv which makes -73dbm equal to 50uv. I think that means
our S-scale is therefore specific to a 50ohm system.

Gary, KE4ZV continued with:

>>Paul, I thought that dbm was referenced to 1mw across 50 ohms. Is that
>>not right?

>No, dbm is simply a power ratio referenced to 1 milliwatt. If you want a
>specific *voltage* to represent a given power level, then you also have
>to specify the impedance across which it's measured.

Right! And apparently our S-scale is specific to 50 ohm systems as it considers 0dbm=223.5mv and 73db down from that, S9=50uv. What was in error in the above statement was the assumption of 50 ohms, which dbm does not neccessarily mean. You're right!

Paul, OH3LWR had said:

>>>One might even ask why signal reports are given in "absolute" units
>>>(dBm, dBuV or even "calibrated" S-units). For communication purposes
>>>the interesting thing is signal to noise ratio, not the signal level.

Gary commented:

>That's *one* interesting thing, but if you're trying to compare antennas
>or amplifiers, or trying to track propagation, knowing relative signal
>*strength* at a distant point may be the interesting thing.

Amen brother! Several reasons why having a reasonably accurate meter would be nice, huh? Also why SW broadcasters would rather have reports in micro-volt levels versus S-meter units! They don't trust'em either for providing really useful information. At the lower signal levels it seems the S-scale makes good sense, but it really gets compressed at the higher levels. Of course, it doesn't help much that it's just not very accurate most of the time either.

My earlier statement:

>>That's why I really like Kevin's suggestion of the dbuv meter that
>>used to be so widely used. Your suggestion about the dbm direct is
>>similar (the one is directly tied to the other of course)! Either
>>does the job better than a S-(illy) meter. At least the references
>>are clearly defined and absolute!

And Gary's response:

>The S scale is also clearly defined, and tied to an absolute value,

It is, but....

>50 uv across 50 ohms for S9 at HF. The problem is that manufacturers
>aren't building equipment that implements the S scale properly. The
^^

Zingo! Not very often anyway, as we've been jawing about here.

>problem with the direct dbm scale is that it becomes cumbersome to
>implement on an analog readout for the wide signal variations possible
>at HF, and digital readouts don't give the proper "feel" for relative
>magnitudes that an analog scale offers. The S scale has few enough
>units over the range of interest to be easily interpreted. It'd be
>nice to have *both* available. ^^^^^^^
^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Someone had mentioned a radio that had both scales represented!
If one was the dbuv scale that Kevin suggested it would be really nice!
In fact, I think it WAS Kevin that said he had one. I'm not sure but
did the 75A-4 have both? Or was it the R-389?

Paul OH3LWR added:

>>In RF-circuits the impedance is usually 50 ohms.

More often than not, but several have corrected me for the earlier
discretion in assuming 50 ohms, HI! :-)

>>In telephone circuits the levels are defined in dBm across 600 ohms.

>>0 dBm across 600 ohms gives 0.775 V and I think this was the reference
>>voltage level in V.U.-meters. Those "VU-meters" found in consumer
>>grade tape recorders are not usually calibrated to this voltage level.

Good grief! You mean VU's aren't really VU's too! Most of'em pretend
to be! I mean they all say VU, right on the meter face, just like our
meters say 'S units' right up front! Is no standard really standard?
:-)!!

<<<<<<<< stuff deleted here >>>>>>>>>>

>>There is a real problem when you can not get a reliable report,
>>it is hard to know if you are using excessive transmitting power.
>>When you get a 59(9) report, the signal at the other end could
>>be anything from just readable to S9+60 dB.

Well, sad to say, but having an accurate indication won't fix this
problem. A few years back I was intent on getting out better on 160
and was involved with an extended project to improve my signal into
Eastern Europe and the Soviet Union. I was adding every piece of
wire I could get my hands on to the radial system on a shortened
(center-loaded) vertical in the attempt to get a better signal into
that part of the world. On air reports from most stations proved to
be not only mis-leading, but a down-right hindrance for the reasons
you cited! I decided to only consider certain stations reports as
being reasonable and I worked them as often as possible as I made
the changes.

Gary, Ke4ZV wrote:

>As I recall, S meters for VHF and above are specified differently.

Ve-l-l-l-l-l-y interesting! I had never heard this before.

>I think S9 is supposed to be 5 uv instead of 50. The steps are
^^
Oh my! And I always thought that RS-232C was the most aborted
"standard" ever!

>different too. 5 uv is a strong signal on VHF while 0.5 uv is
>getting down toward the floor of older receivers. That's only
>a range of 10X, so it's logical that the steps would be smaller.

Gary, what about the guys that are active on the "weak signal" modes
on VHF? I think perhaps you're on to something here when the FM
mode is considered, but I'm not sure. I really never have heard
of this "alternate" scale, but it may help explain why the meters
on FM rigs don't relate well at all as compared to HF anyway.
Interesting!

From the earlier note:

>> Well, I think you're on to something about the FM mode Bob. It
>> should only take a few uvolts of RF to fully quiet the radio, which
>> is what the meter seems to be telling you too! Once the FM detector
>> is fully saturated, more RF on the input doesn't do any good. It's
>> already quieted all the way! So, seems like your meter is set up
>> properly for the MODE! Maybe on FM rigs we should call it a mode
>> meter, not S-meter, huh?

The Paul, OH3LWR added this:

>In many FM-receivers the squelch is controlled by the amount of ultra-
>sonic noise present at the FM-detector output (5 kHz high-pass filter,
>amplifier and noise rectifier). The simplest way to get a signal quality
>indication is to hook up the meter at the noise rectifier output.
>At full quieting, there is no ultrasonic noise and the meter is biased
>to display S9. This "S-meter" *is* actually a quieting meter.
^^
Yeah, a mode-meter 'ey!

Guess that explains why my "S-meter" on the brandy new Kenwood FM rig
can't really be thought of as a real S-meter (if such a thing exists)!
'Cause it's not! Not even close. It's a blinkin' mode (quieting)
meter.

Brett,
I have a DJ-F1T and love it! Also for the money, I believe you get more
features.

Well, think about it for a moment. The distance from the headphone
driver to the eardrum is maybe an inch. Sound travels 1100 fps in
air. So a 180 degree phase shift will occur at 26,400 Hz over that
distance. Since the distance from the left driver to the left eardrum
is about the same as the distance from the right driver to the right
eardrum, there is no net phase shift side to side due to this geometry.
If you reverse the phase of one driver, it'll always reverse the
relative phase heard by the ears.

>FAQ, that's fine with us -- but his reply to my original posting
>didn't strike me as too enthused.

I guess you are referring to me. Technically, I am not "the" FAQ maintainer, as it is maintained by a team of editors led by Ian Kluft (hamradio-faq@amdahl.com). The FAQ never makes subjective or political judgements about what goes into it. Instead, the main submission criteria are:

- Is it a frequently-asked-question?

- Is its presence in the FAQ likely to reduce net bandwidth?

- Have you provided a well-researched answer to the question? (this part is optional, but don't complain if it takes us 6 months to find out the answers ourselves :-).

If you become a large and successful mod site, such that people want to find out about it, we'll be more than happy to add it (much like we've added a reference to the Internet callbook servers).

I gave quite a bit of background on the pitfalls of trying to become "the" mod site (what happens if your site goes away, either because the hardware fails, or the maintainer gets a job elsewhere?) or even "a" mod site (what happens if no one submits mods, or the mods are technically inaccurate or incomplete?). I only ask that you take these things under consideration before forging ahead with a fairly major net-project.

>Our logs show that we have received over 80 ftp connections for the
>mods today. So far, I've accumulated a little over 200 mods, although
>I must confess that noone has yet sent me anything.

>I have taken a walk through all the ftp sites mentioned in the faq,
>and have made a union of what I found.

I've passed all of this info to hamradio-faq and rra-wg (and I encourage you to join the latter, as its a pool of experienced information maintainers who can provide you with a lot of valuable advice and guidance). Again, send E-mail to rra-wg-request@amdahl.com if you are

interested.

>Finally, we would like to ask archive users to please take what they
>need, and not too much more, as we're at the far end of a rather slow
>link, which is used for other things.

Well, realize that if you are providing a high-visibility net service, you are going to get a lot of queries. Is being "the" mod site, combined with being on a leaf-node of the Internet with competing uses for its slow link, necessarily compatible? I'm only asking that you consider the question.

Otherwise, good luck with your project and 73,

Paul W. Schleck, KD3FU

There are at least 2 "versions" of the FT530. Unless the plug you list above
is a new part at Radio Shack, it must only fit the early version of the FT530.
I also searched without luck for a plug earlier this summer. I ended up buying
the plug/cord from Yaesu...

>my horror I found that none of the repeaters listed for the District
>of Columbia seem to be up any longer ...
>

Couple of things here Jeremy,

-- A lot of the repeaters have gone to PL access. This maybe
what you seeing and the repeater is really there, you dont have the
"code".

-- Wonder over to EEB on Mill Str in Vienna or MD Radio in
Laurel, they have the current ARRL Repeater Directories on the shelf.

-- Try these "open" machines. 145.35 in Waldorf MD (wide area
coverage, sits on WXTR's tower), 145.11 in DC, 145.19 (State Dept),
146.76 in Jessup MD (also a wide area machine), 146.91 in Woodbrige,
and 147.30 on Blue Mount Mountain North of Winchester VA (also very
widearea machine). Good luck

You're correct. In phase audio should form a point source seeming to
originate in the center of your head. Out of phase audio should appear
to have a "hole" in the sound right at the center of your head, and
have a diffuse localizer around each ear. Listening to out of phase
audio can be very fatiguing.

>the human mind and the ears make up a beautiful comination. we tell
>the direction of sound by the relative strength between the right and
>left ear. with mono on earphones, the sound intensity is the same
>in each ear. evidently, with phasing, we have the ability to discern
>a change in phase also. see my previous post on the small earphone
>and the null effect, a.k.a the Adams Effect.

Psychoacoustics is a complex subject. Directional effects are the
result of both phase and amplitude differences in signals arriving
at the ears. For sources distant from the ears, the amplitude to
each ear is almost identical, and the phase information is generated

by the convolutions of the ear and ear canal, and the shape of the head. For headphones, the close coupling to the ears negates the normal phase information generated by the shape of the head and the convolutions of the outer ear. The sound is essentially directly coupled to the air column between the driver and the eardrum. So all amplitude and phase information must be generated by the drivers.

One of the more useful boxes you can build is a filter system that feeds low frequenices to one driver and high frequencies to the other. This will allow signals to "move" across your head as you tune the radio. You can then use your ability to spatially resolve signals to aid in separating different signals on the band.

I just paid my $6 homage to Yaesu and bought the @#%@#% connector at Berryville HAMfest this weekend. While I was buying the plug a fellow next to me remarked to my comment that it was 'non standard' At least in terms of Radio Shock parts (Hmmm, I hope RS isn't a measure of standardness, but mebbe..) Anyways, this fellow tells me RS does indeed have the right sized plug.... I just 'humored' the lad, after all I'd spent a while there pulling all the plugs out regardless of their stated size and trying 'em out. (I remember telling the RSdroid "I'll either buy them all, and bring them all back, or you can just let me pull 'em all out of the packaging here.. Save us both time")

Anyways, the moral of this story is that I suppose that boy at the HAMfest was 'humoring' ol' me instead of the other way around... I'll go check out that part number, perhaps it's stocked in a seperate area of the store from where I was looking (like walkmen stuff instead of DC power connectors.

FT-736R

Nice radio for satellite. It tracks both bands properly for mode B, has good stability and sensitivity, good thermal design, and is generally easy to use. The 1.2 GHz module can be mast mounted. The one drawback is not satellite related. It won't allow dual receive on both bands at once. Works well with Mirage amps. It's a little behind the times in it's features, but it's still the price/perfomance satellite radio leader of the three.

IC-970

Very expensive radio. Does it all, but can be somewhat difficult to master. The only real drawback to this radio is the phase noise on recieve. It's subject to intermod from strong nearby signals. Has dual receive, good thermal design, and more features than you'll ever figure out how to use. The 100 watt option means you may not need external amplifiers.

TS-790A

A dog. This radio has several glaring faults. It doesn't track tune without holding down the SAT button. This makes tuning a two handed job in a service where you're always short at least one hand. In fact, the entire user interface sucks. The narrow filter options only work on the main band unit, and that's the only unit that transmits. So for satellite use, where you transmit on main and listen on auxillary, you can't access the better filters. The third fault is more serious, it has horrible thermal design. The radio PA modules get very very hot after even modest transmissions. The 440 PA draws 15 amps for 35 watts out, and that means that the heatsink needs to get rid of about 160 watts of heat, and it doesn't do that. Mine failed thermally after one month of service. It has dual receive and a good front end.

Don't forget about the Standard C168A. I have seen it for $299. I have had
mine for 7 months now and have had no problems at all. It is very small and
yet is a full featured 2 meter HT. Very good quality. Check it out.

While what you tried to do is an admirable example of citizen involvement, it's not what's meant by "self-policing". Self-policing in the context of the amateur service means that we police *ourselves*, not others. That is to say, we each make a conscious effort to be aware of the rules and try to obey them. We are not police in the sense of Kojak tracking down the bad guys. Normally we depend on peer pressure and setting a good example *ourselves* in order to maintain order on the bands. There's certainly nothing wrong with tracking down and reporting evil doers to the proper authorities, but we have no more police power than any other citizen.

>on area)? Also any info on what to look for and what to buy would help.

By far the 2 meter band is the most popular single amateur band in the US. It's where most local FM voice communications takes place, mobile, at home, and with handheld radios. There is an extensive collection of repeaters on 2 meters to extend your line of sight range. In addition, there are other activities on 2 meters, such as grid square DXing, satellite, packet radio, and even bouncing signals off the Moon.

For the last few years of the sunspot cycle, 10 meters has been an active place to work distant stations in the US and around the world by ionospheric "skip". As the sunspot cycle winds down, less and less long distance communications opportunities will exist as the bulk of long distance communications returns to 20 meters and below. You may still find an ocasional band opening on 10 from time to time, and it can be used for local communications with much the same characteristics as CB.

Depending on where your main amateur interests lie, you should choose equipment that matches the operating style you prefer. With a Tech license, 2 meters is probably your best first choice. With a Tech Plus license (code test), you may be more drawn to the DX possibilities of 10 meters. But if DX is your main interest, you want to shoot for at least General Class so you have access to 20 meters where the hard core DX action will exist for the next few years.

Probably nothing more than the segment producer and editor had to cut out stuff to get all their material to fit into 'x' minutes. The result: ham radio got cut onto the floor (so to speak). These guys usually film a lot more than fits into the alloted time frame. For whatever reason, the editor took it out.

There probably was no conspiracy - it was just a judgement call call by someone involved in producing the segment.

Citizen means a US Citizen, either by birth or naturalization. However, the courts have held that many rights and responsibilities of citizenship also apply to legal resident aliens. In some cases, even illegal aliens enjoy some of the rights and responsibilities of a citizen. When the draft was still in effect, my roomate at the time, a resident alien, was drafted into the US Army. But he couldn't vote. Of course at the time neither could I since voting age was still 21. But I outgrew that, he couldn't.

I agree. I was told it had specific language about the use of Amateur Radio in support of Education. Now it appears to specifically prohibit it.

I for one don't need to use a repeater to order pizza, so what exactly is this supposed to do that is an improvement??

That's a good way of looking at it for pure 220 volt loads.

This may have already been brought up by someone but a really good article on the Perseid meteor shower is in the August 1993 Sky and Telescope. They are predicting a meteor storm as part of this shower where the rate will be VERY high for a short period (last storm was the Leonid shower in 1966 with rates up to 150000/hour for a short period).

The author predicts that there will be a storm at about 22:25 UTC on Aug 11. This should be visible in Europe but the sun will still be up here in the U.S (although some of the east may see it). The meteors appear to come from the constellation Perseus (hence the name) which will be in the northeast about the time the sun goes down in the U.S. Viewing should be good from sundown until the moon rises about 1 am. Note that Perseus is fairly close to the horizon when the sun goes down.

You better take another closer look!!!

(5) Communications, on a regular basis, which could reasonably be
furnished alternatively through other radio services.

It seems to me that "regular basis" could easily be interpreted as
a) every year for the same event
b) the same type of service every weekend for someone different
c) whatever the local FCC rep decides it means

I wanted to look into using Packet Radio to link K-12 schools together
for educational purposes. According to this section, that's a no-no.

I thought the idea was to eliminate some of the ambiguity, not just
re-write it in equally ambiguous statements.

I am very dis-appointed. We waited a long time for the re-write that was
going to open things up for providing real support (and even some percieved
value) to the community at large. What we got was permission to order pizza
over a repeater. We really needed that.

The only problem with this idea is that the radio probably has no way to know how much charge the battery had to begin with. Perhaps the charge metering circuitry, and memory, should be in the battery rather than the radio. Then it could act more like a gas gauge, measuring fillups and drawdowns. That would leave only the self discharge currents to be estimated, and they're fairly consistent over time. It'd be nice to be able to glance at a pile of spare batteries and read the state of charge of each.

>Another thing that would be nice to have would be some sort of
>audio anunciatior that would chirp if the battery voltage drops too
>low to power the radio while the the unit is keyed in transmit
>state. It is rather aggrivating to discover taht I've been talking
>into a dead HT for the last minute or so

Some radios do have time out timers, and others limit transmission time by becoming too hot to hold. Most radios only indicate too little battery power by blanking the display or extinguishing the Tx indicator. A chirper, for those who can stand radios that beep and chirp, shouldn't be hard to add. Keeping transmissions short, however, is probably the simplest way to avoid the problem. When you hear your friends wondering where you went when you unkey, you know your battery is low. :-)

I've missed some of this conversation. There will be competition in Delta
division and where else? I think I've heard that the Pacific division
will be contested.

>Which is how the process works. And thrives.

It would be interesting to know whether there is any common ground in the
platforms of the new competition - e.g. if the old directors were all in
favor of the 13wpm requirement and the new blood all opposed. Are these
offices usually uncontested? Is something in particular happening to cause
a move for change?

>asked him what he suggested. He suggested that there was nothing
>that could be done. I was surprised, to say the least.

This really shouldn't have happened this way! There is indeed a correct answer to that question. You should have been told how to report this through the ARRL, or, been asked for your name and address and had the correct response sent to you.

The League booth was staffed by our officers and Directors, HQ staff or local volunteers. None of us know all about *all* aspects of ARRL, but as I was out standing at the League booth, I took down a lot of names and addresses for questions that were outside my own area of expertise. The fact that you did not receive similar treatment indicates that we need to do a bit more training of folks who staff the booth. I will pass that along to the people here who can make that happen.

I checked with Luck Hurder and got an authoratative answer to your original question. Here it is:

Date: Tue, 03 Aug 93 15:24:56 EDT
From: lhurder@arrl.org (Luck Hurder KY1T)
To: ehare@arrl.org
Subject: Re: How should one report a bootlegger through the ARRL?
Message-ID: <1946@arrl.org>

Assuming that the culprit is "acting like an amateur", rather than say, fishing boats on 80, cab drivers on 440 or other obviously non-amateur sources (resolution of which have different paths...), one should provide documentation of violations -- in writing only, with all factual information included -- to the person's Amateur Auxiliary Coordinator.

By "person", I mean the person seeking assistance.

If he doesn't know who his Amateur Auxiliary Coordinator is, he can forward the documentation to his ARRL Section Manager, address on Page 8 of QST.

Often, the knee-jerk reaction is to tell the caller/complainer to call the FCC, which ultimately may have to be done as well, but some areas of the country have Amateur Auxiliaries with very sound and viable relationships with the FCC, such that FCC PREFERS that the matter be brought to the attention of the Amateur Auxiliary Coordinator first.

In short, it's probably best to give the Amateur Auxiliary Coordinator the first right of refusal.

Further to: Electrical code, neutral, and ground: In this part of the world all the stove/range plugs I've seen all have 4 pins - the two poles of the 220 circuit, neutral...and ground. I don't have my code book handy but I don't think we have the exception that allows the range or dryer chassis to be connected to the neutral, which, as is well known, is not euivalent to a safety ground or bonding conductor. The neutral should only be used to equalize voltages between the two sides of the 220 branch circuit, carrying whatever unbalance is needed for such things as dryer motors, timers, or range CO's and lights. Remind me to wear my rubber sneakers when next I visit the US; seems to me rather short-sighted to put this provision in the NEC just to save the cost of 5 feet of wire on a stove or range.
All the cable sold as CSA approved for household wiring also has a bare copper bonding conductor in it - some of the posts in this thread lead me to believe US practice is different.
I wonder how this is done in the UK ?

Ob re.radio.amateur.misc: The dryer and range plugs are identified as "for use with a dryer (or range) only" - would it be leagal to use one of these for a kilowatt linear ?

Hi all. I just acquired a new rig (IC-765) and to my surprise I find that there is ~7.6VDC on the hot mike lead and the rig is low-Z (600) and all my mikes are Hi-Z (except one Low-Z Shure 545). This neccesitated feeding mike audio (Heil element) thru a 1 uFd. cap. The audio is not true to form - actually sounds distorted.

I would like the ability to tailor the audio a bit, overcome the impedance mis-match, and isolate the mike(s) from DC on the mike lead. Any creative suggestions?

Parametric or graphic equalizer? What units are on the amateur-market, what on the audio market? Homebrew?

Your ideas, suggestion and encouragement are greatly appreciated.

>I gave quite a bit of background on the pitfalls of trying to become
>"the" mod site (what happens if your site goes away, either because the
>hardware fails, or the maintainer gets a job elsewhere?)

There is no doubt in my mind that the hardware will fail at some time.
Backups are made on a daily basis for this reason.
And yes, it is possible that I will be moving to another location
eventually. If this were to happen, then moving the archive somewhere else
would be a fairly simple task, and after the initial confusion had
settled down, the FAQ updated, life would be back to "normal". I was
prepared to put some time and effort into creating
a master mod archive, (hopefully with the help of others).
Conceptually, at least, I like the idea of a centralized site for
mods. There is in my mind nothing more annoying than having to dig
around several sites to find what I'm looking for -- and would like to
believe that there are other people who feel the same way.

>or even "a" mod
>site (what happens if no one submits mods, or the mods are technically
>inaccurate or incomplete?). I only ask that you take these things under
>consideration before forging ahead with a fairly major net-project.

Clearly there is no way in which I can verify the validity of the mods
in the archive. Even hunting down hams with the appropriate hardware
would be a gargantuan task. But this is usually the way it is with
mods, at least those that I've been exposed to.

>I've passed all of this info to hamradio-faq and rra-wg (and I encourage

>with being on a leaf-node of the Internet with competing uses for its
>slow link, necessarily compatible? I'm only asking that you consider the
>question.

This is the weak point of the project. The average mod file is
4947bytes, and the standard deviation looks is pretty low. IF (note
big _if_) users limit themselves to taking what they need, I think
that the link bandwidth will suffice. I could be very wrong, however.

If someone who is on the backbone is prepared to take this over from
me, I can provide the current contents of the archive, a list of sites
from which I have merged mods, and a (rather large, it turns out) list
of sites yet to be visited by myself.

I guess what it boils down to is "If not me, the who?".

>Otherwise, good luck with your project and 73,

Thanks!

Bruno

Source record: 278318

I've noticed PC-sourced RFI in my HF-rig as well. The PC is an old XT-clone (Zenith 158), which is an 8.0 MHz 8088 (don't laugh, it logs QSOs and decodes CW just fine, and my "real" computer is a 25MHz 486SX).

My experience doesn't show that it is the monitor that generates most of the noise, but rather the processor/peripherals. Turning off my monitor has virtually no effect on RFI received by my rig. However, what the computer is DOING does effect the tonal qualities of the noise the rig puts out. Therefore, on my PC, my suspicions are the innards of the "brain box", not the monitor.

I'll hedge my bets that on MOST PCs it is also the "innards", not the peripherals. I do this for 2 reasons. A long, long time ago I was a computer programmer on an old IBM mainframe (which would now pale in comparison to even the cheapest PC on the market). One of my co-horts had acquired some software that, when executed, could play various songs as heard by an AM-radio placed in the computer room. According to him (and the author of the "music") the noise was generated by the internal address/data bus, and by carefully selecting the op-codes you could get the bus activity to generate "controlled RFI".

Secondly, I work in the group that designs Engine/Transmission controllers for GM-vehicles. I've been personnally involved with much experimentation and design activities to attempt to keep our "computers" from interfering with on-board radio equipment. Time and time again, the 2 major culprits have been the "system clock" (and the harmonics it generates) and the address/data bus. We've found that on certain processors we use that there are certain types of "small loops" that generate good amounts of "hash" in the FM band; we now no longer do those types of loops.

What can you do about it?

You've tried the traditional "ferrite on the cable" stuff, and it didn't work. Did you "ferrite" ALL the cables at once, or just 1 at a time? We've been playing around with ferrite-filtered connectors for future PCMs (Powertrain Control Modules) and have found that (for the most part) if you don't filter ALL of the wires coming out of the box, you might not bother filtering ANY of them. The RF wants to "get out", and it will take any path it can get. If you plug up a few "holes" over here, then the pressure seems to rise, and it squirts out harder at the other holes (sorry for "the water analogy" again).

I haven't played around much with my home system, since it doesn't bother me much, but I'd try the following (if you have success, please

post results!):

1) Shield ALL cables on computer/monitor/printer/etc with aluminum foil. Wrap a bare wire around the cable being shielded, then wrap the cable with aluminum foil so that it touches the "bleed wire" at several places along the cable. The bleed wires should all be tied together AT THE PC END ONLY (i.e. leave the "far ends" open), and tied to the PC chassis. Any RFI trying to get-out on the cables now have a "capacitor" with a return path to the sources ground. You also provided a "Faraday shield" to prevent capacitive coupling of RFI from the cable to other wires in the room.

2) Ground the PC with a ground strap to a "good earth ground"; just like (presumably) you did with your radio. I wouldn't tie the PC to the rig, then the rig to ground, as you want to avoid having the two share any "common impedance". Take the PC's ground back to the same single-point as the radio.

3) Make sure that all of the metal cabinet pieces of the PC make good "metal-to-metal" contact; where case shells come together, scrape-away paint so that the metal touches and provides a good ground. On some of our PCM cases, recently (development units, NOT production units) the case manufacturer failed to "mask off" the two mating surfaces of the case halves, and we saw "really bad RFI Levels" in our screenroom tests. A few minutes with some 200-grit sandpaper reduced RF levels 20dB.

4) Try the ferrite-on-the-cable trick, but do ALL the cables at the same time. Some ferrites might work better than others. I've had people tell me that the yoke-cores from TV sets are good upto about 100-200 MHz. (??)

5) If you have a "turbo" button on your PC, and the software you run seems to work fine at the slower speed (i.e. you don't fall asleep waiting for something to happen), then run at the slower speed. The RFI levels are directly proportional to switching speed (as is the heat generated by the CMOS ICs inside the PC, so it should run a bit cooler too, and thus maybe live longer). The catch-22 about the slower clock speed is that there will be more harmonic "birdies", however, their amplitude should be less.

6) Keep the PC as far from the rig as possible. This, of course, depends upon your shack layout, but do what is possible. With RFI the inverse-square law applies. The RF level should decrease by the square of the distance you place between them. A separation of 4 feet should be 16X "quieter" (24dB) than a separation of 1 foot.

Hope these help.

One suggestion for the "type" of "big red button" you place in strategic locations. Pick a button style that is somewhat recessed so that bumping-up against it doesn't crash power. Also, make it so that it is not "easy" to pull the button back out (to re-enable power).

I worked in a lab that had a "big red button" next to each doorway (presumably so that in case of fire, you could "smack" the button on the way out the door). One day a co-worker was holding the back-door of a piece of rack-mount equipment; he got tired of holding it, so decided to rest it against the wall. He didn't see the "big red button", and "boom boom . . . out go the lights". As if that wasn't bad enough, he got startled and pulled the button back "out" to resume power (we must not have a "circuit breaker" like that described in the original posting), which it did; unfortunatly the VAXs we had didn't like that too much (I think we lost 1 power supply in a VAX and crashed a disk head, but that was years ago & I've slept since then).

For that reason, the following week, we had the electricians change the buttons so that there was a metal "ring" around the button; protect against laying something against it, and you had to unscrew the ring to reset the button. We called the improved buttons "Stiffler-proof" (named after poor-Bill Stiffler. . . you out there buddy?).

On a (somewhat) related topic . . .

Who WAS the (explitive deleted) genius who chose Black for the "HOT" wire and White for the "Neutral" (which is, for most intents and purposes, "ground")? Didn't that person ever look down at his feet to notice what color Ground was? It sure looks a lot more "black" than "white" to me? At least he chose Green for "Ground" (he must have mowed his grass that day).

Why couldn't he have chosen the "wise" colors that most of the electronics industry seems to have accepted:

Black = Ground
Red = "hot" or "power"

Every time I do wiring around the house I have to tell my self. . . "Bass Ackwards . . . Bass Ackwards" so that I remember correctly.

flame off.

By AM, I take it you mean 550kHz to 1600kHz range? And I am also
assuming you are using a typical transistor portable radio. You might
find you can improve things by running a nice long length of wire out of
the window, looping it around the ferrite rod of the radio a few times and
"grounding" the short end to the radio's chassis - there may even be an
external antenna socket - try that.

Unfortunately, you might create more problems than benefits: depending
on how many strong signals you receive, especially at night, your
external antenna may cause your radio front-end to overload, causing

lots of intermodulation products that bury your weak signal. This is a
major headache in crowded Europe (:-(.

If you are really keen and do have an external antenna input, a tuned
loop might be the answer: a large diameter coil of wire, resonated with
a suitable (variable) tuning capacitor, with a one-turn (or so) coupling
coil into the radio. This has the advantage of being directional (figure of 8)
which can help reduce the interfering signals.

If this is of any interest, let me know and I'll dig out some references
for useful articles.

Happy listening,

Regards,
Andy.

Brendan, I'm a displaced Seattlite living in Canada!
The best radio for this purpose is the GE SuperRadio II or III.
It uses a tuned preamplifier/preselector for very good
sensitivity and rejection of adjacent signals, both valuable in
a radio. In this sense it is more like a short-wave than a
commercial broadcast radio. On the other hand, it has a large
speaker and runs a very long time of 6 D cells. It is basically
the perfect radio to take with you to Saltspring or Orcas island
and still have some connection with the mainland.

The II model is still available at Canadian Tire stores here in
Ontario, I was able to bargain one store down to $70CAN. The III model
has largely replaced it in the States (I'm told) and runs a bit less;
it has some style changes and the quality control is not quite as high --
the lowdown from the net indicates that a fraction of the radios have
reduced sensitivity -- I don't have the range of serial numbers before me.

Finally, the path to Victoria is substantially shorter and over water.
I'm not sure if the AM stations there use directional power so as not
to waste power over the Straits of Juan de Fuca. If you are at all serious
about doing this AM DXing on a regular basis, you might try to reach the

station engineer. They could tell you what the antenna pattern is (and what/if/when they change it for day vs night) and would enjoy getting a report about signal conditions from some far point.

Hi!

It is not exactly an external antenna, but you might try a
loop antenna. Its effect is such that if you just can tell
that there might be a station using the ferrite rod, then with
the loop it becomes completely intelligible.
The loop is basically a coil with about 0.5 square meter
cross-section. About 11 turns of 1 mm wire with 7 mm spacing
between the turns to reduce the self-capacitance is suitable.
The ends of the coil are connected to a 10-500 pF variable
capacitor which resonates the loop at the desired frequency.
This should cover the whole MW. I am using just
inductive coupling to the ferrite rod of my Grundig Satellit 500,
but one separate coupling turn in the loop also works.
The main advantage of the loop is relative portability.
If you need still better efficiency, then in principle
a larger loop with fewer turns should be better. One should
keep the inductance of the loop somewhat constant, i.e.
the product of the cross-section area and the square of the
number of turns. The effective height of the loop is
proportional to the product of the cross-section area and
the number of turns. So in theory one turn with 60 sq. meters
area should be 10 times more efficient. However, I don't know
how this huge thing would work in practice. The maximum sensitivity
of the loop occurs in the directions which lie in the plane
of the loop.
With best regards,
Ylo Mets,
Institute of Chemical Physics & Biophysics,
Tallinn,
Estonia.

What you need is a GE "Super Radio II or III". This radio
takes external antennas (a long piece of wire or frame) and is the
most sensitive radio on the market.

Call around in the yellow pages for this radio. Expect to pay
$40.00 for one.

I get Canadian stations on mine when in Milwaukee Wisconsin.

Yours

At KFJC, we had to build such a thing for our Emergency Broadcast System
receiver.

We use 2.5 turns of #26 wire on a 4-foot (1.33 M) frame, tuned
with a 20-250 pF trimming capacitor. Use it with a decent earth-ground
on your radio and it ought to come in better. The plane of the winding
(not the center of the loop) should point toward Vancouver.

Good luck, eh?

Brendan,

Tell us a bit more about your receiver. Does it have a low-impedance
antenna input? If it is just a glorified table radio, would you
consider buying an older communications receiver for the purpose? The
big problem is not the antenna per se, but the sensitivity,
selectivity and strong-signal rejection capabilities of the receiver.

That said, I used to live in Seattle and could hear the Vancouver AM
stations day and night on my Hammarlund SP-600 and a 60-foot wire run
>from the roof of the house to a tree across the yard. I did have to
situate the wire well away from the power lines outside.

I have a Select-a-Tenna. They advertise in Popular Commuications, Monitoring
Times as well as some other non-communications mags. It's about $40US and
worth every penny. It's approx 10 inches dia by 3 inches thick, has a tuning
knob on the center of one side. The tuning dial is calibrated with the AM
scale.

If you want the address to order just e-mail.

Brendan,

I gather that FM doesn't quite do it for you...I listen to Canadian
stations all the time here in Everett, and generally do OK with the
ones I want in the car down at least to central Seattle.

For external AM antennas: Best would be as close to a resonant antenna
as you could get, I guess. That would be BIG for AM, though. You
can probably do pretty well with simply a long piece of wire going up
as high as you can reasonably get it. A decent ground to work against
wouldn't hurt at all; hams generally put wires on the ground or just
below the surface, radiating out from the "feedpoint." Then to be
optimal, you should have a way to tune the antenna, to match its
impedance to -- um, whatever... you may want to use a piece of
coaxial cable to go to the radio, but you may do as well with simply
bringing the wire end to the radio. This may depend on the radio
itself: does it have external AM antenna connections?

Another type of antenna that could work well is a multi-turn loop.
There are descriptions of these in ARRL antenna books; I could provide
a more complete reference if you need it. If the purpose of the
antenna is simply to get more signal, either type would work, but
if you have an interfering signal, a loop could be rotated to
null the interference.

This is a really short couple ideas for what could be a fairly
difficult problem. Good luck... Let me know what station you
are trying to get (frequency and call letters) and I might be
able to tell you more.

Cheers,
Tom

I have heard them on occasion here in Utah. From the Monitoring Times:

6.005 Montreal
6.070 Toronto
6.030 Calgary
6.130 Halifax
6.160 Vancouver

All of these transmissions are meant for local reception. This means that
they aren't sending out the strongest of signals... Even so, you may still
be able to receive Vancouver from your location.

They also put out international broadcasts on various frequencies at different
times of the day out of Montreal. The best times for reception will be in
the morning and evening. Try the following frequencies:

6-8 PM your time: (broadcast to the americas)

6.120 9.535 9.755 11.845 11.940 9.535 11.845 11.94

9-11 PM your time: (broadcast to middle east)

9.650 11.905 11.925 15.275 15.445

10-11 PM your time: (broadcast to Europe)

6.050 6.150 7.295 9.750 11.775 17.840

6-7 AM your time: (broadcast to North America)

9.635 11.855 17.820 11.955 17.820

7-8 AM your time: (broadcast to Europe)

11.935 15.315 15.325 17.820 17.895 21.455 21.710 11.815 11.855 15.135

2-4 PM your time: (to various)

5.995 7.235 13.650 13.670 15.325 17.820 17.850 17.875 5.960 5.995 7.195 9.755
11.705 11.730 11.875 13.670 15.305

You might be having trouble picking up Vancouver due to something called the
'dead zone' (I think???). SW radio waves reflect best at low angles to the
horizon. If you are too close to the source the radio waves travel too
close to the vertical and don't reflect (you understand this if you've taken
your optics). Try pulling in the signal out of Calgary...

Oh, if you're listening on one of those stubby antennas that probably came
with your radio you're not going to pick up much. Connect a length
of wire (50 feet works pretty good for me) to your antenna or auxiliary
input.

Good luck!

Everett Robinson

A friend of mine said that KMart was selling GE SuperRadio III's.
If not, try a BEST store if there's still one in the area (Bellevue?).
This is an AM/FM radio that sells for $35-$50 with better than average
performance.

As I remember it though, some Canadian friends said that the pattern
for one of the main Vancouver stations has a null in this direction
to prevent interference.

If all else fails, the FM station comes in well on 92.1 and the
French language station on 97.7 is a bit weaker but usable.

I just tried my shortwave on 690 kHz, and got something, but
since in I live in sight of the 710 KIRO transmitter, the interference

was pretty bad.

Hi Brendan,

Just a quick note to get you started! (Things are a bit busy
here so I haven't had the time to do an exhaustive search).

Two references you might try for general information are the
ARRL Amateur Radio Handbook (big and pricey but good value, so borrow it
unless you are really into amateur radio (:-))
and
Monitoring Times, a magazine which specialises in Short Wave Listening.

A pal has given me an article from "Communications Quarterly" Winter
1993 issue: Small Loop Antennas. It looks just what you need. I will
try to scan it. Do you have anywhere that I could ftp it to? Failing
that, how big a chunk will your mailer accept? I can mail it as a
uuencoded gif file, say.

Summarising from the magazine article, the essentials of a loop
are (assuming you want to cover the range 550kHz to 1700kHz):

A frame - a cross of two bits of wood around which to wind
some wire, on a suitable stand; the loop (about 210uH); a tuning capacitor
(typically 10 to 365pF for the medium wave band); a fixed capacitor (or
trimmer, say 5 to 40pF) and a piece of co-ax cable to connect to the radio.

If the frame is such that each turn is about 30cm square, then
the main loop should be about 15 turns. The tuning capacitor goes
across the open ends of the loop and a separate 1 or 2 turn coupling
loop wound around the frame with its open ends connected to the coax
which you then plug into the radio. The actual number of turns depends
on the frequency range you wish to cover, the dimensions of the loop and
the tuning capacitor you have available. There will be a certain amount
of "suck it and see" to optimise things.

The mag. article even has a way of tuning a "remote" loop in
the attic, even, using varicaps.

One real advantage of a tuned loop is that it reduces the risk
of overloading your receiver with local signals because the loop is

quite narrow band and also reasonably directional.

Sorry if I am sounding too preachy or if you already know this -
it's always difficult to guage how to pitch a response.

The article has the information to design your own antenna
describes their use and benefits.

Hope this helps you pull in your station. Let me know how best
to send you the article.

Good Luck and Best Wishes,

Andy,

There are a number of potential solutions:
- An external antenna which is loosely coupled to the ferrite rod
- Listen to CBC on shortwave
- Some relatively expensive antenna/preamp combinations

- A better radio

The radio of choice for those who want to DX on the AM band is the G.E.
"SuperRadio". It is a very sensitive and selective AM portable for under
$50. Accept no imitations -- get this brand and model!! I suggest that
you call around, as not every G.E. dealer carries it. Its nice to try
out a solution without investing in it, so you then may want to take the
best AM portable you now own with you to the G.E. dealer. Then compare
it to the SuperRadio in the dealer's parking lot (away from interference and
shielding) before buying the new radio.

What kind of receiver are you using? Do you have room outside to
string up a long piece of wire?

Well, that's what I meant in saying that the slippery word "regular" is there. The FCC has refused to give concrete examples, leaving it up to the amateur community to do what's "reasonable".

To my own way of thinking:

1. Support of a once-a-year (or even several times a year) event is not "regular".

2. Daily/weekly scheduled events on behalf of some other entity probably are illegal, but this doesn't prohibit amateurs from gathering in however many scheduled nets they can stand to discuss whatever amateurs want to discuss, just as they do today.

3. Events such as severe weather nets which happen from 0 to 5 times a week during the summer are not "regular".

The FCC did make it OK as part of the 97.113 changes for a teacher to be a control operator of a school station and be paid for teaching at the same time. This was one of the main problems that I've heard in the past regarding educational usage of ham radio. If you're talking about having school groups interact via packet radio I'd be surprised if you'd have a problem any more than any other regular amateur packet net (or DX cluster). Without prohibitive expense, I doubt that what you have in mind could be "reasonably furnished through other radio services". It would almost certainly be a more constructive use of packet radio than 99.9% of the traffic I see!

73,

John, NK0R

>The police (FCC or otherwise) can't be everywhere, so they depend on
>reports from the public to let them know what they're missing.

This raises an interesting point (at least for me). The question is whether a citizen has police powers.

First of all, it should be pointed out that the existance of police forces are a relatively recent phenomenon. During the founding of the US, problems were dealt with by the militia (defined as being all males between 18 and 45). When there was a problem (criminal or otherwise), ordinary citizens would be gathered to combat the problem. I believe that early police forces were unarmed people whose purpose was to keep and eye out for trouble and to gather help from the armed citizenry should the need arise. Over the years, the powers and privileges of the police has grown while the rights of the citizenry has been slowly stripped away.

There is also the concept of citizen's arrest (which exists to this day). The difference between citizen's arrest and a police arrest is that the police is not responsible for their actions while a citizen is. [This is NOT a comfortable feeling for me since this allows the police the license to play Rambo. Note the recent court decision in NJ which allows the police to kill citizens with impunity when in pursuit of a criminal.]

Furthermore, court precedents have clearly shown that the police is NOT required to render assistance when the citizenry needs it. In other words, the police is not required to do anything when 911 is called. Thus, there is a need for ordinary citizens to have the means to protect themselves from criminal elements.

Thus, on a theoretical level and for hazardous circumstances (e.g. rape, murder, etc.) it is important for citizens to have the ability and the right to act as police.

With respect to something as trivial as a bootlegger, I would have to agree that it would be far better to leave it to those who we designate to handle the problem in our name. [Note that I am not saying that we do not have the power or the right to do something but that we have allowed another party the

privilege to do it for us.] The liability problems of being wrong is significant. [see my third paragraph] and is probably more trouble than it is worth.

Hello,

I have a Kenwood 741. I am thinking about adding a third band to it. The trouble is, I can't decide which one I want. :-)

I'd like to hear from people who have installed a third band unit. Which one did you install? Are you happy with it? If you have your radio in a car, what did you do about an antenna for the 3rd band? Recomendations on a tri-plexer?

Has anyone done any research into having more than just 3 band units, and doing some sort of switching to select *which* 3rd band is in use?

Scholarship winners

The Dayton Amateur Radio Association has announced winners of its
1993 student scholarships. They are: Barbara Curry, N4TCC; Steven
Fook, N2PIF; Martin H. Gruen, KA2VLD; Dwight A. Harris Jr., N0NTM;
Jerry A. Hensley Jr., N8HUT; Dean Madsen, KE0WO; David C. May,
KA7STL; and Matthew Minney, N8PIG.

Each student will receive 2,000 dollar(s) toward tuition at a school of her
or his choice. Information on applying for 1994 scholarships will
be available from the DARA after January 1, 1994.

This corrects an earlier bulletin.

Yes! Use that 7.6 volts. Install a source follower stage between the
mike and the rig. It'll match impedances so you get rid of that nasty
distortion and roll off. You can build it on the back of the mike plug.
Use of appropriate RC time constants in the stage can give you some
audio shaping as well. Use 1/8th watt resistors, a plastic cased FET,
and tiny tantalum caps. It'll fit. If it doesn't, use a bigger hammer. :-)

You could always throw some printout on the fire so you could see
better. :-)

US codes require emergency lighting circuits.

Us> Oh yeah, yeah, yeah....the truth is you goofed! The recent reorg
Us> of the radio newsgroups was designed to cut DOWN the number of
Us> posting to 'rec.radio.amateur.misc'...this was all discussed and
Us> voted on...your posting is outside the charter Mister! GO READ IT
Us> FOR YOURSELF! I didn't notice a callsign on your postings..Hmmmm
Us> is it possible that "BigSteve" ISN'T a HAM?? ;-)

Everytime I decide to go get my ticket I meet someone like you and push it
back 6 more months. Right now it's set for May, 2014.

Us> | uhuh...cart-before-the-horse,
Us> why don't you take your 'journalism'<---------| somewhere else?

The story is already in a Florida newsletter and when I get off my duff and
send the raw material to WA6ITF, it will be on Newsline too. Reminds me, I
also have to send it to Hap for the R.A.I.N. report.

Us>Nobody cares,

I would, Alan Weiner is going to chose the frequencies. Alan's noterierty
as a pirate overshadows his hatred for Hams. He was once turned in by one.
I know Weiner, you don't. I'd be concerned if he decided to plop those two
non frequency agile 40KW signals in the middle of 40 and/or 20 meters.

>the whole topic of such stuff is salt in the wounds of Amateur
Us> Operators anyway, since commercial broadcast has been composed of
Us> wannabe's since the 1920's...commercial radio INVADED amateur spectrum
Us> and the government did NOTHING about it!

Learn your history. Radio was first intended to be a way of contacting
ships at sea. It was thought that there were enough land telegraph and new
fangled telephone lines available at the time. It was the Navy that was
in charge of the development of radio until c.1921 when the Department of
Commerce took it over. Even at that time there were only 5 wavelengths
available for use. The difference of license classification between
commercial and amateur was that commercial was for advertising a business
while amateur was for personal and experimental use. Hams could, AND DID,
broadcast to the general public. The govenment did do SOMETHING, they
pushed the hams to the upper end of the dial above 1400 Khz., (later 1800
Khz.), and let broadcasters on below that spot on the dial.

> Similarly, most Pirate
Us> stations run with little or no interferrence until they cut into the
Us> existing Status Quo...I read what you wrote, nothing was said about a
Us> license application, a filing, nothing of that nature...your brand of
Us> 'journalism' stinks! It's short on law, short on truth, and long on
Us> speculative verbage without documentation! >

Gee, $20,000 fines are not interferring? Reread the original message, I stated that Fybush had discovered from the crew that Becker had gone down to St.Kitts to finalize the deal. That sounds like a license or an official government sancitioned station, which doesn't require a license. If governments did there would be very few radios in military service and none at embassys.

Us> WRONG! Discussions about newsgroup content are appropriate anywhere
Us> EXCEPT where a 'group.d' subgroup is provided for said discussions. You
Us> really haven't read the intro to Usenet have you? RTFM "BigSteve"!!

Read it? That piece of gibberish! The only thing it does is further segregate SIG's within the hobby. Sure an HF contester might not like being grouped with AMSAT users, Packet net affiliates or ATV operators, but that license entitles you to certain priveledge_s_, it doesn't make a further deliniation as to what particular privelege you can only use. Why would anyone really want to put himself in a cubby hole? Unless he was a single minded techno hermit.

Us> And while you're at it, fix your site's mailer - I tried to email you
Us> only to have your site bounce my email...look into your domain naming
Us> and the config files for your mailer!

Don't be a know-it-all. It's an intermittent problem between Rutgers and UUNET. Our mailer works fine, it's Deamon that screws it up and there's nothing we can do on this end but complain. Of course if dorsai did bounce it, you didn't address it right.

BTW, steveny@lopez.marquette.mi.us is my alternate address, I go on there every two weeks or so. Unfortunately for most people, I have the sysop, KB8EOH, purge my mailbox every 5 days.

>If you can't do anything but insult, then you prove that your complaint was
>invalid in the first place. Only people with low IQ's tend to insult
>and/or curse. Obviously you didn't understand the original message, it was
>beyond your comprehension.

Us> Oh blither and blather!...Go away Coletti! We don't like people that
Us> cross- post fluff!

Can't top that one, eh? Well try this. There is a Ham on another network that constantly whines and calls all other hams "BORING" in glorious ASCII oversized letter graphics. I never thought there was another ham like him until I saw your reply. So please, go crawl back into your techno hermit cave and save all the other users the bandwidth.

Us> -... .-. --- -.. -.-. .- ... - .-. .- -.. .. --- --..-- - .... .

Lucky me...NOT still waiting anymore...at last.
Dated 7/27.

NOTE:
I called the FCC turkeys on the 28th and they claimed to know nothing!
Waste of time calling them. Don't bother. Either too bloody lazy to look
in the computer when I asked them or they lied, or.....?

Took about 11 weeks. Approximately 1 week locally 2 weeks at the
Association for Retarding Radio Licensing and 8 weeks at the FCC.
All kidding, aside the ARRL does have it significantly more together than the
FCC, (as it should be). The FCC appears clueless.
Mine apparently hit the FCC while they were still
quoting 6-8 weeks, (June 4).
They quote 10-12 now.
Good luck!

>feature.

Best in what? Price? PD or pay.. User interface? a UI is more of a
personal choice than anything else. What do you want a graphical or
a numeric output. Size of machine is of little importance if you
just want the software to tell you when its within view. What antennas
will you be using, What OSCAR's? If your antenna has a 20deg
wide beam pattern and your working AO13 you want the antenna
pointing in the general direction. If you just want to hear
the suttle on your HT or scanner using a duck all you want is
something to tell you when the craft is in the area. I have not
purchased yet, but I like the track boxes that are out. I dont
want to waste my CPU to tell me when a sat is near, just flash a
light beep and pont my antennas.

Depends on the activity in your area.
I got a TM-942 for my new truck, since there's a significant amount of 1.2gHz activity around here. I am getting a Comet triband antenna and triplexer.
A 742 with 220 added would also be a good choise, I think.
Comet makes a triband antenna and triplexer for that combination, also.
Just my choice and opinion.

All this talk of 'arrests' by the FCC......amazing!

It certainly should be common knowledge between a bunch of radio 'professionals' like us that neither the FCC or it's employees have ANY statutory arrest authority, save that that every citizen has.

To effect any seizure or arrest, they must have a court order and the physical presence of a peace officer, in most cases a US Marshall is used.

Sigh......

After looking at several handheld dualbanders, I am only lacking information on one, the 530. Are there any users out in netland who happen to have one? What about users who have researched and decided against it. I am especially curious about the following:

-what is the audio quality?
-what is the durability factor (in your opinion)
-if you were to buy another radio tomorrow, what would it be.

Thanks to all, I truly appriciate any and all advice.

copied from packet:
Subject: IC-2IA LOUSEY XMIT AUDIO FIX
From: K8CIT@N8NNN.#SEMI.MI.USA.NA
To : INFO@ALLUS

HELLO FOLKS...I BOUGHT AN IC-2IA LAST WEEK FOR USE BY MY XYL KB8CZL. I CHOSE
THIS PARTICULAR HT FOR ITS SIMPLICITY OF OPERATION (AFTER INITIAL SETUP).
HOWEVER, IT DIDN'T TAKE LONG BEFORE WE BEGAN RECEIVING POOR XMIT AUDIO REPORTS.
IT WAS DESCRIBED AS "MUFFLED AND CONSTRICTED - LIKE TALKING THRU A GARDEN HOSE".

AS IT TURNS OUT THE DESIGN ENGINEERS AT ICOM LEFT NO PROVISION TO GET THE
MELODIOUS TONES OF YOUR VOICE TO THE MICROPHONE EXCEPT TO GO THRU THE PLASTIC
CASE.
AFTER I NOTICED THIS PROBLEM, I RETURNED THE RADIO TO MY DEALER AND TRIED
SEVERAL OTHERS. THEY ALL SOUNDED THE SAME. THEN THE SALESMAN CALLED ICOM
SERVICE-THEY ADMITTED THEY KNEW OF THE PROBLEM AND RECOMMENDED A HOLE BE
DRILLED IN FRONT OF THE MIC.
HERES HOW TO DO IT - PROCEED CAREFULLY-
1. SHUT OFF RADIO
2. REMOVE BATTERY PACK
3. REMOVE 4 PHILLIPS HEAD SCREWS FROM REAR OF CASE
4. CAREFULLY PULL OFF FRONT OF CASE
5. GENTLY REMOVE MIC ELEMENT FROM RUBBER HOLDER
6. UNSCREW 4 PHILLIPS HEAD SCREWS RETAINING SPEAKER
7. SUPPORT CASE ON SOFT SURFACE
8. DRILL HOLE THRU CENTER OF MIC RUBBER FROM INSIDE - I USED 5/64 INCH DRILL
9. REASSEMBLE IN REVERSE ORDER
10. MARVEL AT FB AUDIO
THATS IT, FOLKS...HOPE YOU LIKE YOUR NEW HT AS MUCH AS WE DO...73, ART-K8CIT..
==========
Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

In article <1993Aug4.093441.819@physc1.byu.edu>, peterson@physc1.byu.edu writes:
|> The author predicts that there will be a storm at about 22:25 UTC on Aug 11.

Please keep in mind what this prediction was based on! Nothing more
than guesswork! What we KNOW is:

1) The "normal" Perseid peak, such as we have reliably every year,
should come at about 12UT Aug 12.

2) We cross the plane of Swift-Tuttle's orbit at about 1UT Aug 12.
The comet's orbit is currently very near Earth's orbit. The comet passed
by this point 200-something days ago. The possibility of a meteor storm
exists.

3) In 1991 some observers recorded a short-lived but strong peak
about 3 hours after Earth crossed the plane of Swift-Tuttle's orbit.

4) In 1992 some observers recorded a short-lived but strong peak
at just about the time Earth crossed the plane of Swift-Tuttle's orbit.

=>>> To deduce that the peak this year will "therefore" come about 3 hours
before Earth crosses the comet's orbit seems to be extremely speculative,
at best. Be suspicious of anybody who claims to know the time of the peak
to the nearest minute!

My Conclusions from the same data:
If you REALLY want to be SURE of seeing the storm (assuming one even
happens at all), you should be prepared to keep a watch out for several hours
each side of the orbit plane crossing. No telling when exactly a storm might
happen, or how long it could last. Chances are it will be sometime around 1UT
August 12, but who knows?

Even if it happens in the daytime you might not be completely out
of luck: If the storm is massive enough, it should be possible to see the
occasional daytime fireball.

Also, consider trying your hand at meteor scatter propagation: tune
your radio to an FM station over the horizon, say 200 miles away. The
ionization caused by a meteor trail should reflect the station's signal and
let you hear it for a few seconds. (Start finding a good frequency for this
for your location now!)

If anyone does see a storm, if you have a second post a quick
mention here (even better, please send me e-mail too!) so I'll know to get
outside and look for those occasional daytime fireballs! The Hawaii
Astronomical Society Meteor Group has set up a radio beacon on the Big Island

and equipment to listen for meteor-scattered signals from it here on Oahu,
and plans to continuously record the results over the period August 10 to 14.
I'll post if I hear of anything interesting from them.

British/European code requires emergency lighting, which is enabled
automatically if the AC supply is lost (for whatever reason). Our units
use Nicads or gel-cells to power small florescent tubes. The gel-cells and
Nicads are replaced annually as part of standard maintenance; quite a number of
the batteries that are pulled in this way seem to migrate into my shack....

We also have 'Emergency flashlights' that fit into holders on the walls;
there is an AC supply to a coil in the holder, which keeps a reed-relay
in the flashlight held open. When the AC supply dies, the relay is released and
the flashlight turns on, helping you find it in the dark.

I havew an FT530 and I am delighted with it. Also by removing one solder blip you get air craft with am detector (you can stroe which detector to use in the memory) and also 900 mhz including cellular. It is a dream radio and I soule buy another. Ithas only one negative and that is something may hts have and that is a bit susceptible to front end intermod. I t si probably the best of the dual banders here though.

>
>-what is the audio quality?

I am quite pleased with the audio quality of mine... I know that I've heard
others which didn't sound quite as good, but I don't think there's *that*
much deviation across other high-end handhelds.

>-what is the durability factor (in your opinion)

Well,it definately feels quite solid to me! I certainly don't think there's
much of a chance of the BNC connector breaking off or anything like that.
Someone once told me that his FT-415 (same batteries) developed a loose
physical fit with his batteries, but that seems rather bizarre to me.
(Not the contacts, but the mounting bracket, or connector, if you will.)
Overall, I'd rate the durability as high, but I can't perform any drop tests
for you (nor will I drive over it in my car, like the Alinco ads suggest
possible. :-)

>-if you were to buy another radio tomorrow, what would it be.

A 530, definately. It's got all the features I need, and then some.
I plan on keeping mine for a real long time...

I have a TM-741 and I originally added a 50Mhz module to it since 6M was the only band I did not have between 160m and 70cm. Well, I soon discovered only one repeater that I could hit in the NYC area and I never manager to find anyone to talk to on it. Also, the channel 2 interference was serious enough in my own apartment to give me fits. I finally traded it with someone in California for a 220Mhz module which is more active in this area than 6M. I might have opted for 1.2Ghz but there is only one repeater that I know of in this area (World Trade Center) and I figure I'll wait until activity starts to pick up. One other fellow who I talk to quite often puchased a new TM-741 when they were being closed out and he had the module installed by the vendor.

As far as someone transmitting without a license...

I don't think that someone transmitting with valid operating authority would have any problem with showing even "Joe Citizen" proof of operating authority. If the person DOES become upset that you have asked, then they probably have no license.

Just like when a cop pulls you over at night...If you're in doubt at all about whether the cop is really a cop, ask to see his/her badge. The cop understands that you just want to know that he/she is legit, and will generally show you the badge without question. A fake cop (yes, this is a problem in some areas) will probably get offended that you would ask.

Someone transmitting on a frequency on which I'm allowed to, and EARNED the privilege to, who is doing so without permission, should be confronted. If it were just a case of the person stopping while I was nearby, I might do my best to "stay nearby" for as long as possible...

I wish I could pull over everybody who tailgated me on my 8-mile trip to work. Just pop a little light on the roof, pop out, and say, "Look, Bud, I'm a cop, and you're putting me in danger, so I'm writing you this $100 ticket. Surprise!!! Have a nice day."

Not a safe assumption - some people don't appreciate having their right to operate questioned.

Drive a beater (64 caddy should do), wear a helmet and slam on the brakes for a dog (jeez - didn't YOU see him?). Another good one is to slow down to really get them upset - so that they pull in closer, then tap the brakes enough to make the nose of your car dive - and at the same time floor it... I did this once and watched with amusement while the bozo locked em' up. I ran into him in a store not 5 minutes later and he was still shaking and apologetic...

302. Re: CHeapest place to mail order a HT?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-05 13:24:28 UTC
From: drt@athena.mit.edu
Message-ID: <DRT.93Aug5092428@cacciatore.mit.edu>
Source record: 278228

In article <23muji$mg6@hub.ucsb.edu> uznerk@mcl.ucsb.edu (Andrew Krenz) writes:

I'm in the market for a HT pretty soon, and was wondering if there was
any particular place out there which offers very good prices or service.
Particularly, I'm interested in either getting an Alinco DJ-580 or a
Yaesu FT-530. I understand the Yaesu is a better radio at a higher price,
but right now I'd say that I'd probably buy whichever one I can get a
better deal on. Any advice would be appreciated..

Any advice? Okay.

Have you given due consideration to the fact that it may be worth the
money to buy locally? Strictly as insurance, there are two
benefits:

1. If something goes wrong, it's far easier to plant yourself on their
doorstep and make yourself a general thorn in the side. Letters get
thrown out, phone calls end after a few minutes, but it's really hard
to ignore a dissatisfied customer who refuses to budge while
eyeballing you, up close and personal. This is "squeaky-wheel" consumerism.

2. If something goes *really* wrong, small claims court is much closer
and less costly - a postponement or two doesn't blow expensive plane
tickets. Easier to collect, too.

Plus your local store might manage to stay in business if you and
others buy from them.

Of course, there's a price for this. Maybe it's not worth it to you
and you still want the lowest price. (I've ordered by mail myself.)
Maybe you have no local store. Maybe you do, but it's full of lame,
price-gouging scoundrels. OK. But reputation and accessibility are
factors to consider.

You don't necessarily get what you pay for. You *always* pay for what you
get. (Pithy, no? But much too true.)

304. Alinco DJ-F1T

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-05 13:38:31 UTC
From: Gary_Thorburn_at_Notes-Gate@sceng.UB.COM
Message-ID: <9307057445.AA744554311@sceng.UB.com>
Source record: 278324

There have been lots of inquiries about this fine, tough little unit
lately, so I thought I'd post the MOD for extended xmit and receive.
Also, there is a Gordon West audio cassette tape about how to program the
DJ-F1T. I got the tape free from a guy at an Alinco booth at a hamfest.
It's really helpful.
The mod below is exactly what I did, guided by the Gordon West tape:

Modifying Alinco DJ-F1T: Open the unit by removing battery
pack, then the three recessed screws in metal back, and the
recessed screw below the Xmit button. With unit face
down and Xmit button to the right, hold the battery release
button so that metal back will come out as you lift the
right edge of the metal back. Imagine that it is hinged on
the left. It is NOT hinged here, in fact there are two
delicate ribbon cables you must be careful not to damage.

With the unit open, you will see two wire jumpers, one
red, one blue. Cutting the RED wire enables air band
receive. Cutting the BLUE wire enables extended transmit.
I suggest you don't cut the blue wire unless you have good
reason to.

Put the unit back together, and reset it by holding in the
function button while you turn it on (say goodbye to anything
in memory !) The extended functions are now available.

The "B" button now toggles AM/FM receive. In AM mode, your
frequency range is extended to include the Air band.

As good as any other radio, and significantly better than the Icom ICW21AT.

>-what is the durability factor (in your opinion)

Seems well built, with the right materials. I havn't dropped it yet, but
it seems like it should hold up well.

>-if you were to buy another radio tomorrow, what would it be.

Dual Band Handheld? Hmmmmm, Icom IC-W2A or ICW21AT or Yaesu FT-530...

I previously owned the all time greatest HT to date, the Icom IC-W2A (IMNSHO)
but it had problems... After a couple years of heavy use it developed an
intermitent power problem (on/off) and the BNC became detached inside, and
audio deviation went way low... Icom says it's 'Not cost effective' to repair.

ugh

But, the radio was a gem, wonderful performance across a WIDE bandwidth, and
nifty 30Kc steps (grin) (The FT-530 forces 12.5Kc steps in the 800-950Mc band)

The Yeaseu is a better computer though.. power saving features rivaling
notebook computers. Nice remote control, backlight LCD display Speaker/Mic(!)

With better audio performance and a LCD display in their remote control speaker
Mic I will go back to Icom for the next rig, perhaps.

A few questions:

I have not been able to confirm that you can store the AM or FM mode in the
memory. There seems to be no mention or even implication of such a feature.
Have you empiricaly observed this? I notice that I can easily detect AM
transmissions without changing modes from the keyboard, is this perhaps what
is happening to you and you are assuming it's in AM mode? I'll try it myself
and see. (BTW, the Icom IC-W2A, and probably this years versions, the IC-W21AT)
automaticaly switch to AM, nice huh?

As for cellular, don't you find the 12.5Kc steps to kinda of make that a
useless feature? (it's a kind of band that you _have_ to scan to be effective)

(Of course I always use a dummy load when listening out of band :)

As for intermod, oh yeah... Forgot about that. Typical Yaesu Intermod
Performance.

>I didn't notice a callsign on your postings..Hmmmm
>is it possible that "BigSteve" ISN'T a HAM?? ;-)

Well, this doesn't seem particularly relevant. I don't recall ever seeing anything in the group's charter restricting discussions to hams with callsigns only. That would sort of make the perennial time-from-test-to-license thread pointless, now, wouldn't it? :-) Now, yes, it's also true that the posting was on a non-amateur topic, but that posting is history and our flaming about it (including this message :-) is just decreasing the S/N ratio on this group.

On the other hand, from the callsign.cs.buffalo.edu server, there are only a few Colettis listed with licenses:

No Steve Coletti. So if he has an amateur license, it's a recent one. Maybe he's a new no-code Tech -- that would tie two threads of flamage together nicely. :-)

In any case, who cares if there's a posting about a pirate station here? Even if posting here about it could be prevented, do you think that that would affect the pirate station itself at all? No way! So you find pirate radio objectionable...fine! I find 14.313 objectionable, but I don't stop there every time I tune across the frequency to harangue them about what they do there. :-) I might complain a bit about somebody complaining about them on another part of the band, but that's only because there's some chance of getting the complainer to stop, whereas there's no chance of getting 14.313 to stop. And so it is with this discussion. :-)
-Not-so-big Steve, WB3I

>

Well, YOU may be disappointed. But most everybody else seems delighted.
Here's some exerpted information that we're providing to our ARRL/FCC
Amateur Auxiliary people, which might make you see how positive a
change the new ruling actually is:

"A few items of the R&O are worthy of highlighting here. One, the
FCC has relaxed the prohibition against using Amateur Radio as an
alternative to other radio services such as the maritime services,
land mobile radio services, or the cellular telephone service.
Mong other things, this removes the ambiguity that has plagued
ham groups in providing communications in public events. It should
end those kinds of situations in the past where hams have had to
debate every aspect of a communications effort as to legality
prior to engaging in same."

"Second, amateurs have debated for years, some vociferously and on
the air, about the legalities of ships at sea ordering parts
and having them shipped to ports of call. This also applied to
missionaries' communications with church headquarters
back home and a number of other situations. This is all okay now
and much of the accompanying on-the-ai debate, much to the relief of the
weary lot of us.

"Third, hams will be able to more fully satisfy their personal commun-
ications needs. This means that, yes, now hams can order pizza via
the autopatch to use the classic example. They will be
able to make or break dentist appointments. They will, however,
still not be able to call their businesses for messages, or
run a message service for hire. The rules still specifically
prohibit "communications in which the station licensee or control
operator has a pecuniary (business) interest, including communications
on behalf of any employer" and for "hire or for material compensation ..."

"Finally the FCC has stated that any amateur-to-amateur communication
is permitted unless specifically prohibited. This means that if th
the rules don't say in black and white that you can't do it, you can.
And, if you're still not sure after applying this test, then we must turn
to the amateur radio community itself for the answer and NOT the FCC.

"And that leads us to the bottom line in all of this: The FCC has given
us more latitude in fulfilling our promise, but with that comes
a much greater responsibility for self-regulation and cooperation than ever before"

If you are interested in knowing where you are (Maidenhead, for example), there
is now a small handheld GPS receiver available from Trimble Navigation
called Scout GPS. Price is approx USD700.
Call 1-800-959-9567 for more info.

(I have nothing to do with Trimble, this is FYI only)

Source record: 278239

Did anyone in Northern New Jersey notice a power surge at 7:14 a.m. EDST ? We did about 20 miles away from a 230 KV line failure in East Hanover Township NJ. A conductor of an overhead 230 Kilovolt line snapped across Merry Lane and contacted the static wire of a lower voltage system. With automatic rerouting, JCP&L Co. was able to prevent any further outages. However, what a light show that must have been when it grounded out. On the other hand, it makes you wonder how safe it is to walk under one of those monster lines. The surge was bad enough to the JCP&L Co. service area in North Jersey that some computers that were not on a proper UPS system had big time problems. The local newspaper facilty said their systems where effected.

I love my 530. The built in speaker is pretty tiny, but that is the price you pay for small radios. I got the whiz-bang remote control mic, it's speaker is about twice as big, very good audio.

As far as durablity goes, I dropped mine from 3 feet onto concrete, in the rain, (no, it wasn't on purpose :) and aside from a few scratches, there was no damage.

If I were to buy another ht tomorrow, it would be a 530.

Black is the color of mourning, and you could get real dead fooling with black wires. Unlike red and green, black and white are easily distinguished by even the color blind. Making a mistake with green and white isn't as serious as making a mistake with black.

>Every time I do wiring around the house I have to tell my self. . .
> "Bass Ackwards . . . Bass Ackwards" so that I remember correctly.

And every time an electrician gets around electronic wiring he has to say the same thing to himself. And electricans came first. Why didn't electronics follow the established standard?

I am in desparate need for some National Semi MM2114N static RAM.
This part is obsolete and none of the distributors I've contacted have any.
Nat Semi has been unable to help. I'm hoping one of you might have some
laying on a shelf or in some old piece of equipment. I need 10 pieces.
If you have any or have any suggestions, please contact me.

Thanks
John

You forgot the step where they ignore the application for 7-8 weeks. Do they really get that far behind? Based on your description and the recent statements that the ARRL VE/VEC take less than 2 weeks, I should have had my license in hand after 3 weeks. I recently did some calculations and found that the FCC issued about 399 new licenses in region 0 in the month of June. I suppose that if you multiply that by the 10? regions, then they issued roughly 4000 new licenses in June, their busiest Month. This of course is assuming that all regions have the same number of applicants and that all new applicants are General or Technician. Add to this the number of address changes and upgrades and I suppose they would tend to get overwhelmed with paperwork. It is also easy to understand why they are unable/unwilling to tell you where your application is until it is entered into the computer and therefore traceable... and by the time they can tell you where it is, you would have it in a few days. Perhaps they should refuse to trace an application for anyone other than the issuing VEC...

: "white" to me? At least he chose Green for "Ground" (he must have
: mowed his grass that day).

: Why couldn't he have chosen the "wise" colors that most of the
: electronics industry seems to have accepted:

: Black = Ground
: Red = "hot" or "power"

The Standard in the US (and a substantial part of the western world) is
for alternating current only:

earth ground = grounding conductor = safety ground:
green or green with one or more yellow stripes insulated wire, a bare
copper wire, or metallic conduit.

Neutral = grounded conductor: (note difference of ...ed vs. ...ing)
a white or gray insulated conductor. May have colored threads woven in
the insulation for circuit id (rarely seen anywhere but industrial sites)

hot leads :
insulated conductors of any color but green, gray or white.
used for power leads.

The convention in DC power seems to be black = negative, red or white
positive. I am not sure if there is any actual regulating standard for
this.

As to that poor soul who just wanted some advice on how to make
his shack a little safer. Go down to your town's or city's building
inspection electrical inspector's office. find out the following things:

1: Can you (not a licenced electrician) do some or all of the work?
Commonly you will have to get a licenced electrician to pull a
permit and approve the wiring plan. and to inspect and make
final connections to the building wiring. You can do the
actual installation yourself. If the electrician is feeling
cooperative he/she may buy the materials for you (at contractors
discount) The only unusual items would be the mushroom switches
and the boxes for them. Everything else is very standard.

2: What exactly is the electric code for your place.
For example Washington DC uses the 1984 NEC with an addendum,
not the 87, 90, or '93 codes.
Get a copy if you are going to plan it yourself. That will set you back
about 20-30 bucks. Or pay an electrician to plan it for you.

3: Auxilliury generators have *LOTS* of hairy regulations attached to
having them. Find out what they are. This is something I would
absolutely have an electrician do for you. Not to mention the issues of
fuel storage, exhaust venting, noise control, vibration isolation, etc...
Look into local zoning and noise control ordinances. closely.

4: How much does the city charge for a permit? The inspection?

And some free advice, worth more than you paid for it.
when you plan your installation, you are going to find out how much power
you are going to draw to size out breakers, switches, wires, etc...
Assume a generous margin for growth in the future, and add it to the
power estimates as "future growth" size the wiring from your service for
the increased load. Have a grossly oversized ground conductor run, and
wire some of your outlets as isolated ground recepticales. This will
make a lot of interference problems in your shack go away. It is more
expensive though.
Read the chapters in the NEC about computer rooms, isolated ground
systems, in addition to the obvious chapters. Look at the exceptions
chapters, one may apply to you.

Good luck and be careful.

How about something like this . . .

Since one of the key factors that the human mind uses for location determination is time delay between the ears (for "low" frequencies, which I suspect 300Hz to 2.4KHz is), then . . .

If one could apply a frequency-dependant time delay (sort of like a phase shift) to one of the earphones, then the horizontal "position" of the dits-dahs would "spread out"; low tones on the left and high tones in the right, let's say. You sould set-up the system so that the 800Hz (or whatever you prefer to listen to) CW tone of the desired signal is "centered" (i.e. 0 time delay between left and right earphones).

I'm not sure how this should be done. Any DSP experts out there?

326. Washington Co., Oregon Antenna Restrictions Delayed!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-05 18:31:23 UTC
From: dreeves@ese.ogi.edu
Message-ID: <57202@ogicse.ogi.edu>
Source record: 278246

This is a summary of an article entitled "Commissioners delay decision on amateur radio tower proposals" which appeared in today's (5 August, 1993) Oregonian (the Portland Metro newspaper).

(A word of background: The Washington Co. Commissioners had drafted proposal 414 which would have restricted antennas above 150 feet and put a fee ranging from $25 for a 35-60 foot tower to up to $1250 for 60-1250 foot towers.)

HILLSBORO - Everyone found so many faults with proposals for regulating amateur radio towers and antennas Tuesday that the Washington County Board of Commissioners delayed doing anything until next year.

.....

Amateur radio representatives especially objected to proposed restrictions on broadcast tower heights, on where the towers could be placed on property and the fees recommended for putting them up.

[The phrase "could be placed" refers to the requirement for 100% setback from any "structure" of more than 120 sq. ft, such as a tool shed. "Heights" refers to the 150 foot absolute limit, where other "public service" orgs. are allowed 200 feet.... (despite the fact that part 97 uses the words "Public Service"....)]

.....

"This thing has gotten way out of hand, from beginning to end." Commissioner Roy Rogers said in voting to delay action.

.....

-- End of summary

Well, thanks to all of you from near and far who faxed your comments to the commissioners. We're safe for another year.

Until next time ....

Seems like 90% of of the traffic on this net is about license delays.

The solution is simple. Just shut down the entire VEC testing system for about 7-8 weeks and let everything in the pipeline clear and the FCC get caught up. Then when testing resumes the applications should right though with no delay.

Now if you believe that..... :-)

I, too, just visited RS here in Corvallis, OR and found the jack. It
was individually packaged by the locals, labelled "270-1575 SONY brown
tip" and carried a price tag of 4.99 which I considered way too high.
The 270-1575 is designed to plug into a 2 amp fast blow fuse protected
cigarette lighter cable, also available at RS (I didn't bother to
memorize the part number) with a price of 10.95.

To answer the last question first, it is available by ftp on:
rahul.net in the pub/davidj/radio directory.

In answer to the question that wasn't asked, the APRS software is not,
as suggested above used to interface the LORAN or GPS NMEA output to
packet, but instead reads such information put on packet by others, and
indicates on a map where the transmitting station is. The software is
also useful as a local "chat" type network. It is used in the DC-Balt area
very sucessfully. Each station using the software serves as a digipeater
for the other stations (each station sets mya to either "relay" or "wide").
All communications are done with a map of the area on the screen, and as
new stations come on line they pop up on the map. Pretty neat.
Back to how the NMEA info gets on packet, if you use a programable prototype
board, where you can specify what NMEA phrase is desired, all you have to
do is set your tnc in conv mode, and hook up the NMEA output directly to
the TNC (you need to set the time interval so that packets are transmitted
only once every few minutes) (also, you need to set your unproto so that
unproto packets are addressed to aprs via either relay or wide). In my case,
I had a commercial GPS that put out about 8 different NMEA phrases every
2 seconds. I had to use a laptop computer to pick out the proper phase,
and output it to the tnc every couple of minutes. This can be done with
only 1 com port btw. Once this is done, when I drive to or from work, my
location is sent out over packet, and my wife (and anyone else on the
system) can see where I am on the map (not sure if this is good or bad).
APRS works best on a freq with little or no other
traffic, and is worth investigating. It has been used to track the
carrying of the army-navy football, the Tour du Pont bike race, and the
Cycle across Md event, among other things. BTW, I have no connection with

it other than being a happy user of it. BJ n3jlq

As an OO the metric I'll use will generally be a daily basis as
oppossed to once a month/week/year, etc.

As an example if someone makes a phone patch once a month to their
mom...who cares. That is allowed under the current 97.113 as
far as I'm concerned(though there are those that would argue even
that.)

> stuff deleted
> c) whatever the local FCC rep decides it means

Well, this is always the case anyway. At which point it's time for
my favorite FCC Notice of Violation Story. A friend of mine was in
a 3 way contact with a W4 and a 5Z4 if memory serves. He got sighted
for third party traffic because there were three people in the conversation!
When he approached the FCC monitoring station about the violation (cuz
we couldn't find anything in the provided transcript that lent a clue
to how they got there) he was told to forget about the notice by a rather
embarrassed FCC engineer ;-)

> I wanted to look into using Packet Radio to link K-12 schools together
> for educational purposes. According to this section, that's a no-no.

Well.. then there are still some things that aren't going to be
allowed via amateur radio.. but at the same time the number of
things permitted has VASTLY increased. The cliche "don't throw
the baby out with the bath water" comes to mind.

Electrical wiring has been around a long time. I worked for an electrician
many years ago, mostly on very old buildings in Boston. The black & white
convention
goes way back. In fact, I suspect that it derives from an early practice
to insulate HOT wires with black rubber or tar, and cover neutral wires only
with cloth.

>Greg Chartrand (greg_chartrand@qmail.ssc.gov) wrote:
>In my humble opinion, I find the filter not to be very effective in
>enhancing weak signals. It is better suited as an accessory that makes
>"casual" listening less irritating.

It is all a matter of physics. The Signal Quantization Ratio is the
ratio of signal power to noise power and the higher the better.

SQR = 1.76 + 6.02(N) - dynamic range

where N is the number of bits in the A/D conversion. Assuming a 70 db
dynamic range for audio in a communications receiver...

A/D Bits 8 12 14 16

SQR -20 4 16 28

In other words, eight bits just doesn't hack it on the ham bands.
It is easy to see why the W9GR low-cost DSP kit doesn't work well on
weak signals. In my opinion, one needs 14 bits minimum in the A/D
converter to perform well on the ham bands. Anything less than 14 bits,
(IN MY OPINION), is not worth the money. 8 bits IS low-cost and you
get what you pay for. This seems an ideal application for a 16-bit
sound board with delta-sigma A/D conversion and they are around $150
assuming one has a computer... like everyone reading this.

>"white" to me? At least he chose Green for "Ground" (he must have
>mowed his grass that day).

>Why couldn't he have chosen the "wise" colors that most of the
>electronics industry seems to have accepted:

I worked as an electrician for a short period and asked pretty much the same question because it didn't fit the wire color logic used in electronics. The answer that I got was that all wires, except green and white, are colors and are used to designate power "hot" circuits. All colors are then used for switched power and the specific color allows the discrimination between circuits with BLACK being "hot" at all times.

From an electricians point of view, the coding makes sense and is easy to follow when wiring a structure. The color coding works well when troubleshooting existing circuits. Once I caught on to the color coding scheme, I had no problem, but I must admit that I was troubled about BLACK being "hot" when used on the job and BLACK being ground in my ham shack..

>land mobile radio services, or the cellular telephone service.

I'm not buying this until I see the R&O text. The text of the new 97.113
still includes the prohibition:

"(5) Communications, on a regular basis, which could reasonably be
furnished alternatively through other radio services."

Which of course, means no email over the ham airwaves, since other services
exist to provide that service (and are as expensive as all heck).

Unless the R&O states otherwise, I agree with Bill, we've been had!

Frankly, I now see no point in developing advanced communications technologies
using Amateur Radio if we can't USE them on a day - to - day basis.

Guess it's time to start reading up on the applications process for the
Experimental Service...

ARLX013 Swapfest cancelled

Swapfest cancelled

Because of flooding, the Western Illinois Amateur Radio Club
Swapfest scheduled for August 15 in Quincy, Illinois, has been
cancelled. Club officials said the loss of Mississippi River
bridges and the need for club members to continue to support efforts
of the American Red Cross forced their decision.

A scheduled volunteer examination session will take place as
planned, according to WIARC treasurer Dick Frey, K4XU.

From: jerryp@key.amdahl.com
Message-ID: <23s7lg$el@neuromancer.key.amdahl.com>
Source record: 278271

Thanks to all who responded to my earlier post about ham-shack EPO.

A shorter term problem:

My new(?) house is 38 years old and has (mostly) two prong (no ground)
AC-outlets.

What is the correct (according to code) way to put in grounded plugs?

My plan has been to run a separate bare wire from a copper stake and a
cold water pipe to the grounding terminal on the three wire plug. Is
this a.) a good idea, b.) legal and c.) the most efficent way to do
it.

I figure this bare wire would also ground my radios and the static protected
work bench I have in the shack.

BTW - the bare wire idea is for my shack and workroom only. The XYL won't
tolerate it the rest of the house. But we have a similar problem there.
Any suggestions.

Many Thanks
Jerryp

In article <23r0c1$beo@cville-srv.wam.umd.edu> ham@wam.umd.edu (Scott Richard Rosenfeld) writes:
+As far as someone transmitting without a license...
+
+I don't think that someone transmitting with valid operating authority
+would have any problem with showing even "Joe Citizen" proof of operating
+authority. If the person DOES become upset that you have asked, then
+they probably have no license.

Then you think wrong. I certainly would not whip out a license
to prove that you were wrong just because you asked, if for no
other reason than because it's intrusive.

That's no different than a cop pulling you over while driving
just to see if you have a valid drivers license. Would you mind
that?
+
+Just like when a cop pulls you over at night...If you're in doubt at all
+about whether the cop is really a cop, ask to see his/her badge. The
+cop understands that you just want to know that he/she is legit, and
+will generally show you the badge without question. A fake cop (yes,
+this is a problem in some areas) will probably get offended that you
+would ask.

Again, you know not whence you speak. First, a uniformed cop will
have their badge visible, so you won't have to ask to see it. It
will typically have a number on it, but not their name, which will
be on a seperate nametag (at least in the SF Bay Area). They also
have a cop photo-ID, which they will often resent pulling out, at
least before they've first seen YOUR ID, and run it, and perhaps
pulled you out of the car. Resist at any time and you're asking
for the cop to do something physical to you.

I can buy everything I need to become a fake cop by mail order,
including badges. The most expensive part would be the fake cop
car or bike.

You probably are referring to "FM VHF" rigs here??

Let's see, of the rigs I measured (Kenwood TR-7950, TM-732A, TH-77
ICOM IC-3200A, Yaesu FT-726), the "S9" or damn-near-full-scale
reading was typically -103 to -100 dBm, which translates to about
2 uV +- some variation. Its interesting that they were all very
similar.

It actually is a reasonable and useful scale for FM. When the signal
is almost unusable (a few tenths of a uV) the meter is hardly
indicating. For signals in the several uV range (full quieting), it
shows full scale.

Just forget the 6 dB per S unit (or should I say per LED/LCD bar?).

349. CB for sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-06 03:23:16 UTC
From: elesatz@du.edu
Message-ID: <CBBIqs.74D@du.edu>
Source record: 278276

For Sale: President "Dwight D." base/mobile CB. In all honesty this is a base station, because of its large size, unless you plan to mount it in an RV/Truck or set it on the back seat of a car.

40 CH AM. Runs on 110 or 12V, plugs direcly into AC socket.

Has digital clock with alarm (buzzer only/radio only or both) as well as a sleep timer (good for you CH 9 monitors).

Controls include Channel changer, Volume, Squelch/PA, Mike Gain, RF Gain, Tone, SWR/CALibration (for built in SWR meter), Delta Tune (fine tuning. Comes in handy when there is splatter).

Button Controls: ANL (automatic noise limiter), Meter reading SWR/RF pwr, Channel 9 Priority.

2 backlit analog meters with green/red printing:
- SWR/ % Modulation
- S meter (RX strength), and TX power out

LED indicators (Red): Channel #, TX, CH 9, RX (green), AWI (will light up if the coax is disconnected from the radio or something is seriously wrong with the antenna).

Misc: 2 external speaker jacks (1/8"), PA jack (1/8"), headphone jack (1/4"), mobile mounting hardware, schematics. Excellent condition!

All original boxes and packing material. Approximate dimentions of radio are 12" x 16" by 4".

Reasons for selling: 1) Moved and don't know any CB'ers here and 2) got into ham radio.

Looking for buyer around Atlanta area or could do Houston area. Please call (404) 351-8110. I won't be on the net for a while, so please don't e-mail if you are in Atlanta or Houston. If you are outside Atlanta or Houston, you can mail me and I'll get back to you on Aug 16th. Thanx!

Price: $100

I have tried both methods on a Les Logan bug. By adding weight I could get it down to about 18 WPM by doubling the length of the arm I could get it down to about 10 or 12 WPM and It worked pretty well.

Real world trials often show flaws in theretical discussions.

I've had the same experience with a video extender - I decided my desk setup would be easier with one, and I picked up a cheapie. Big mistake (although I'll admit it's now on my PC again, but then I haven't even turned the HF rig on in over a year). Can anyone suggest a place to get video extender cables that are decently shielded?

Po> Well, this doesn't seem particularly relevant. I don't recall ever
Po> seeing anything in the group's charter restricting discussions to hams
Po> with callsigns only. That would sort of make the perennial
Po> time-from-test-to-license thread pointless, now, wouldn't it? :-) Now,
Po> yes, it's also true that the posting was on a non-amateur topic, but
Po> that posting is history and our flaming about it (including this
Po> message :-) is just decreasing the S/N ratio on this group.

Thank you, you have sense, unlike the "moron", (oops, can't repeat that,
that description of Mr. S. came in private E-Mail).

You have to realize that I am used to talking to Hams like Tom Sundstrom,
Bill Newkirk, and Bill Pasternak. These guys realize that SW broadcasters
can be listened to by hams on the same receiver. They also are concerned
that these old clunker transmitters and inefficient antenna systems can
cause spurs all over the spectrum. Posting the item for reference was done
as a courtesy to the more open minded out there. However there are A-holes
who just don't get it, do they?

Whether or not you liked the item is of no point, it is a public news
group for miscellaneous items. Since this item WAS of some interest to some
hams, it does fit, albeit sideways in the group. You wouldn't expect it to
be in r.a.packet would you?

Po> On the other hand, from the callsign.cs.buffalo.edu server, there are
Po> only a few Colettis listed with licenses:

That wasn't necessary, you know? How would you like someone publishing
your home address on a global news service?

Po> No Steve Coletti. So if he has an amateur license, it's a recent one.
Po> Maybe he's a new no-code Tech -- that would tie two threads of flamage
Po> together nicely. :-)

I think you've seen my other reply by now. ;-)

Po> In any case, who cares if there's a posting about a pirate station
Po> here? Even if posting here about it could be prevented, do you think
Po> that that would affect the pirate station itself at all? No way! So
Po> you find pirate radio objectionable...fine!

It remains to be seen if it will be a pirate or a licensed station. The lid was blown on this caper, he HAS to go for the license.

>I find 14.313
Po> objectionable, but I don't stop there every time I tune across the
Po> frequency to harangue them about what they do there. :-) I might
Po> complain a bit about somebody complaining about them on another part
Po> of the band, but that's only because there's some chance of getting
Po> the complainer to stop, whereas there's no chance of getting 14.313 to
Po> stop. And so it is with this discussion. :-)

I tune in to 14.313 for a laugh every now and then. Here in NY we have more outbanders around 13 meters than lids on 20, great for blue language. It's where Hams and CB's get together on equal terms. (Holy Cow! I said something on topic, shame on me).

Po> -Not-so-big Steve, WB3I

>
>In other words, eight bits just doesn't hack it on the ham bands.

Ahh, I beg to differ. Cecil's formula correctly gives 50 dB as the signal to noise ratio in an 8 bit system sampled close to the Nyquist limit. The typical signal to noise ratio in a HF SSB communications channel might be 30 dB, frequently a lot worse and not often much better than 30 dB. A 50 dB signal to noise ratio is perfectly adequate in an HF post processor. To argue otherwise would be equivalent to saying that a garden variety cassette tape recorder, which might have a 50 dB signal to noise ratio if you're lucky, is not good enough to record HF SSB signals!

What DOES matter is setting the audio level properly into the DSP. Most modern HF receivers have excellent AGC circuits capable of maintaining levels within a few dB. If a signal is below the receiver's AGC threshold then a separate audio AGC may be useful, or the audio level may be adjusted manually.

The title of my QST article was "LOW COST Digital Signal Processing..." (emphasis added). Sure, if you want to spend more money, you can have more bits. But 8 bits *IS* more than adequate for the vast majority of HF DSP.

50 dB > 30 dB

Hello,

Thanks to all the people in this newsgroup who took the time to respond
to my query regarding "What % of people used paddles..."

The most common responces were:
1. Go with a paddle when you start, but you have to practice a lot.
2. Start with a straight key, and when you reach the threshold speed
switch to the paddle.

The most popular paddles : Bencher, Vibroplex and Kent.
keyer : CMOS Super Keyer II.
If anyone is interested in the all the responces that I got, send me e-mail
and will send them to you.

Thanks again for all the comments regarding use of paddles.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Well...I guess I'd give myself a D+ for HAM-server over the week or so.

I placed a second HD online to create more disk space for HAM-server files then proceeded to mess up all the config files so that HAM-server couldn't find the new directory. For three days I couldn't post or send email.

So, radio pals, if you have ordered from HAM-server within the last week or ten days and have heard zip, reorder.

Sorry for the inconvenience.

BTW...there is now close to 40-megs online.

Really? I thought black was always ground or neutral. You see over here we use Brown for live, Blue for Neutral and yellow/green for Earth. If only there was a common international standard! Some US gear arrives in the UK with these odd black/white wires and unless you are familiar it is easy to get it wrong. I expect the same applies with UK gear in the USA though as we don't make anything anymore it is probably not a problem.

It would make sense to have red for live, as it is a genetically programmed danger colour and hot, green for ground, neutral? Well black or blue I suppose. Blue signifies cold. If you are colourblind hark luck, unless we put some form of stripes on the cable. There are many more people out there who are not coulourblind than who are, so some form of natural selection by electrocution may take place. Seriously though, the UK use of yellow/green earth wire does limit the confusion if you cant tell green from brown or red.

I am sure the brown/blue/green&yellow standard was chosen for a good reason, even the shade of colour is specified.

Mike

Recently there was a discussion about handheld gps receivers in
alt.toys.hi-tech. I'll post an abstract...

O /
\/
/\ ~~~~~~
O \

The Sony Pyxis is generally considered to be a mediocre product.
Handheld receivers from Rockwell, Magellan and Trimble all give
superior features, at least the same performance, and similar prices.

Pyxis was Sony's first run at the GPS market, so I would expect their
future products to be a lot better.

>>Obviously greater cost = greater accuracy, but this is just a "feeler"
>>question though definative information would be great.
>
>Actually, I think they're made to be inaccurate...

No, the navigation receivers are limited by the DOD's 'Selective
Availability' dithering of the GPS signal at the source. SA limits
accuracy to within 100 meters 95% of the time (2 sigma). Without SA,
basic navigation receivers are accurate to about 25 meters.

Various tricks (like differential correction and narrow band
correlation) can improve accuracy but they aren't in the price range
of most people. The relationship of cost to accuracy seems to be
exponential.

There is a mail digest list for people interested in GPS, moderated by
Ken Jongsma. Send mail to "gps-request@tws4.si.com" to subscribe.

> >- What is the (general) accuracy of such equipment.

milspec to 5m or better depending on size (bigger=more satellites for longer,
and more computing power to deal with it). Handheld to 30m or so, again

better if milspec'd.

> >Obviously greater cost = greater accuracy,

> Actually, I think they're made to be inaccurate...

I believe the military will not allow them to be more accurate than a certain
threshold. Trimble apparently have a work-around for the max-3-sat. limit
on civilian gear that works on a time-averaging system, but are not allowed
to sell it to anyone except the US military. Apparently there is a survey
version (1 tonne-ish with generator and control room type setup) that will
get down to the cm range if you don't move it for long enough (hours). Useful
for baseline data in the field - they then make it a local-satellite type base
because you can get very accurate differential positions quite easily. Presumably
because an ie 32-bit counter-timer can run much faster when measuring the time
from pulse X arrival to pulse Y arrival than for X-send to X-receive.

Again, IMHO, from a promotional talk by a Trimble recruiting agent followed
`by conversation with a mate who works there. Apparently they all use
differential positioning for surveying, because the 30m limit is crap if
you're trying to build ie a road... "it's straight and level, boss, to 30m
each way".

>- What is the (general) accuracy of such equipment.
>

Depends on what equipment you buy and how the Department of Defense
is feeling this week. Assuming they are not screwing up the signal,
you can get 3-5 meter accuracy with a hand-held receiver, but that
would be $2k. 10-15 meter accuracy can be gotten under $1k.

Millimeter accuracy is available with Differential GPS, which is
on the horizon.

If you want a cheapo consumer GPS, consider the Trimble Flightmate,
the Magellan 5000A or the Garmin GPS 75 or 95. Other non-aviation
GPS recievers can be gotten from Boating and other fine nautical
magazines for less. They usually do not have aviation related
databases, and some don't even show elevation, but they are cheaper.

>- What is the cost of such instruments.
>

$700+ for aviation GPS, less for marine.

To answer what might be your next question,
yes some GPSs offer an rs-232 port over which you can get
a coordinate stream (usually at 4800 or 9600 baud).

Further information on GPS can be found in almost any recent
aviation magazine -- the FAA is giving pilots the option
to navigate via GPS (with backups).

: Thanks to all who responded to my earlier post about ham-shack EPO.
An Avalanche... (good volley, eh?)

: A shorter term problem:

: My new(?) house is 38 years old and has (mostly) two prong (no ground)
: AC-outlets.

: What is the correct (according to code) way to put in grounded plugs?

...shall be connected to a grounding conductor installed in accordance
with section 210-7(c), which basically states that it shall be part of
the branch circuit wiring. But a Grounding Conductor may be connected
to any accessible point on the Grounding Electrode system as an
exception. It must be enclosed in a raceway to protect from damage, or
concealed, unless it is six gauge or greater in size.

: My plan has been to run a separate bare wire from a copper stake and a
: cold water pipe to the grounding terminal on the three wire plug. Is
: this a.) a good idea, b.) legal and c.) the most efficent way to do
: it.

d. none of the above.

: I figure this bare wire would also ground my radios and the static protected
: work bench I have in the shack.

It is ok as a supplement, and may be bonded to the grounding
conductor. But the earth will not suffice in itself.

: BTW - the bare wire idea is for my shack and workroom only. The XYL won't
: tolerate it the rest of the house. But we have a similar problem there.
: Any suggestions.
Hire an Electrician.

Note that according to the Code, for life safety purposes, GFCI's are
an acceptable alternative to replacement with grounded outlets.
However, this doesn't help keep the noise down, and certain appliances
require the grounded outlet - such as a microwave, possibly to keep
emissions down.

It seems to apply to the multimode rigs too, at least my 736R shows S9
for a 5 uv signal. Because of the effect of aperture at VHF, a 50 uv signal
at the receiver would be *really* strong. The transmitter would have to be
about 30 db stronger than an HF transmitter to give the same microvolts at
your receiver (assuming antennas of equal gain).

>

That reminds me of another "stupid highway trick." I had an old dodge truck I used to deliver newspapers with. When it was fully loaded, the headlights aimed up a little and were probably a problem for small cars, but that's why they have day/nite mirrors.

I was behind a porsche one night maintaining a safe distance. He kept hitting his brakes causing me to have to slow down hard. After six or seven of these, I signaled and got into the center lane. As soon as I did, Mr. Porsche slowed way down, dove into my lane behind me and lit up like a search light. He turned on his brights, his KC running lights, hell, if he had a flashlight he was probably shining it out the window. My truck had those huge side mirrors (the better to see YOU with) and suddenly I couldn't see a thing.

So... I had 2600 pounds of newsprint in an old pickup truck, doing 50 MPH at night, and suddenly go blind. What would you do? I stood on the brakes and did the best I could at keeping in my lane.

I didn't even feel him hit me.

Luckily another driver had seen everything and confirmed my story to the police. Mr. Porsche: did what had to be $5,000 damage to his car, got a ticket for reckless driving, spread 150 copies of the Sunday Arizona Republic across Shea Blvd., and put a 6 inch scratch in my bumper.

I guess he tought ME!

> convention
> goes way back. In fact, I suspect that it derives from an early practice
> to insulate HOT wires with black rubber or tar, and cover neutral wires only
> with cloth.

It can be confusing since for AC BLACK is hot and WHITE is neutral/ground
but for DC BLACK is negative (ground) and RED is positive (HOT).

When working with DC and the wires are not RED and BLACK then I always try
to use the color that is "closest" to RED (in the color spectrum) for
positive and the other end of the spectrum for negative. It is my own
quirky system. If both wires are the same color I tie a knot in the positive
lead.

Also, for audio circuits (stereo) I always follow RED = R = Right channel
and BLACK = Left So if the cables are RED and BLACK then RED is Right.
If they are BLACK and GREY then BLACK = Left. If they are SILVER and GOLD
then I say GOLD is more like RED than SILVER is so GOLD = Right.

I guess it works for me. Haven't blown anything up ... yet :-)

When all else fails I use labels :-)

Does anyone have one of these "low-priced" (say, <$1000) units, and
if so, how accurate have you found them to be? Have you checked the
locations against benchmarks, or USGS topo sheets, for example? I'm
especially interested in elevation accuracy, which is harder for
GPS to handle, and harder to verify, as well.

I said I was unable to verify the storing of AM/FM mode in a memory on
my Yaesu FT-530. I asked the poster whether they had this in their manual
and/or had empiricaly observed this behavior.

I suppose the answer to the first is a qualified 'no' and the second a 'no'
by virtue of a non answer.

The qualification for the first answer is that 'the guy' gave him a 'sheet'
I have no idea really who this 'guy' was, or what the origins or context
of the 'sheet' were...

I still cannot confirm this feature. Either empiricaly or by documentation.

According to a survey I did, this is the only one w/Maidenhead (actually,
an extension of the Maid. for increased precision to reflect the
25 m accuracy the GPS provides (according to a recent App. Note from Trimble)).
The product seems to be of superior quality. We have had previous experience
with Trimble Handhelds, and they are extremely rugged.

I wouldn't recommend the Sony to anyone doing serious work....

Magellan tends to be too bulky, for my use, anyway.

373. Micors... How to make them full duplex and retune

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-06 15:51:47 UTC
From: phil@hansen.ncd.com
Message-ID: <23tumjINN67i@rosebud.ncd.com>
Source record: 278200

I am looking at putting up a full duplex link between my two repeaters. I have
been told that Micors can be retuned to the 420-430 band and I am interested
in doing this.

Although I have experiance with MVPs, ICOM repeaters, Master EXEC II, etc...
I have no experiance with Micors...

SO...
If you are a Micor expert.. I would like to get some answers to the following
questions:

1) How to make the Micor FULL duplex?

2) How big is the Micor? (I have to consider the rack space :-(

3) How to tune the Micor from 450-470 to 420-430? (I guess some coils need
adjusting)

4) Does it use Crystal elements or something else (raw Crystal?)?

5) Is there anything else I should know?

Thanks in advance!

From: garhow@hpubmaa.esr.HP.COM
Message-ID: <23tus6$8i5@hpscit.sc.hp.com>
Source record: 278202

I heard a report on NPR this morning saying that the Coast Guard has
abandoned its practice of monitoring the 50MHz (or KHz?) frequency
for SOS distress calls. The reasoning was that with all the global satellite
and cellular communications available the CW call for help is obsolete.

How sad!

Not to open a very large can of worms but this seems to open to door for
CW to be considered obsolete in a lot of other areas as well.

From: mohan@tulip
Message-ID: <1993Aug6.113321.5237@uoft02.utoledo.edu>
Source record: 278201

Hello,

The Antenna Handbook and some other antenna books say that an antenna has to be atleast 1/2 lambda above ground level to have good radiation pattern.

Now, if my simple dipole antenna is 2 ft above the roof of building 80 ft high, Is the antenna 80ft above ground level?

I have wire dipole antennas for the 40m, 20m, 15m and 10m bands, above a building and want to know how the building affects the radiation pattern of the antennas.

Thanks for any information.

<Several scary tales of tailgaiting incidences deleted.>

Well, let's see if I can get into a usenet discussion that won't
turn into an anti-ARRL flame war. :-) (Hey, we like to have fun, too!)

I have never been a proponent of the brake-test method of
discouraging tailgaters. Some of them take it as a personal
challenge. I used to just take my foot off the gas and slow down
gently until they finally got frustrated enough to pass me.
Then I discoverd windshield washers! I have learned that tailgaters
will usually back off if you turn on the windshield washers. My
theory is that they are not too sure what is coming off of your
car and they are worried about their paint job; after all, it
might be corrosive. (This is real easy to believe about some of
the beaters I drive!) So, they back off.

Now, I have my doubts about the sanity of people who will willingly
risk death and destruction by driving a foot or two from the car in
front of them, but will get real concerned that they might get a
few spots on their paint, but, then again, I have questioned the
sanity of LOTS of drivers I have met over the years.

|> DJ-F1T. I got the tape free from a guy at an Alinco booth at a hamfest.
|> It's really helpful.
|> The mod below is exactly what I did, guided by the Gordon West tape:
|>
|> Modifying Alinco DJ-F1T: Open the unit by removing battery
|> pack, then the three recessed screws in metal back, and the
|> recessed screw below the Xmit button. With unit face
|> down and Xmit button to the right, hold the battery release

Here's two questions for DJ-F1T owners:

1. After the extended receive modification, is it possible
to scan NBFM feqquencies in the 135 - 145 mhz range such
that the radio will only stop scanning if the channel
has a desired CTCSS tone? It's important that the
radio continue scanning, even if a given channel has a
signal (but not the desired CTCSS tone).

2. Any comments on imaging or intermod regarding the Alinco
DJ-F1T?

I'm thinking of making this radio my next purcahse...

|> weary lot of us.

Matbe you had better read it again. Because both of the above are still
prohibited.

>> (3) Communications in which the station licensee or control
>>operator has a pecuniary interest, including communications on behalf
>>of an employer.

Both of the above violate the " communications on behalf of an employer"
clause above. So that hasn't changed a bit.

|>
|> "Third, hams will be able to more fully satisfy their personal commun-
|> ications needs. This means that, yes, now hams can order pizza via
|> the autopatch to use the classic example. They will be

|> prohibit "communications in which the station licensee or control
|> operator has a pecuniary (business) interest, including communications
|> on behalf of any employer" and for "hire or for material compensation ..."
|>

Here you point out the "employer" problem yourself. Why couldn't you see
the conflict above?? Could it be because the re-write is just as ambiguous
as the original (maybe even more??)

|> "Finally the FCC has stated that any amateur-to-amateur communication
|> is permitted unless specifically prohibited. This means that if th
|> the rules don't say in black and white that you can't do it, you can.
|> And, if you're still not sure after applying this test, then we must turn
|> to the amateur radio community itself for the answer and NOT the FCC.

This last statement is totally absurd. It is not the "radio community" who
is going to levy the fines when you violate the rules. And I hardly expect
the FCC to accept "K?4??? said it was OK!!" as a defense.

|>
|> "And that leads us to the bottom line in all of this: The FCC has given
|> us more latitude in fulfilling our promise, but with that comes
|> a much greater responsibility for self-regulation and cooperation than ever before"
|>

The FCC has given us permission to order pizza over the radio and for teachers to
get paid for talking to the Space Shuttle on an HT. I was expecting a bit more.
I go out for my pizza anyway.

Oh, by the way. Make sure you have your broker check your portfolio before you
call Domino's. If you have any of their stock, you could be in violation of
the "pecuniary interest" clause when you place that order. ;-)

Maybe we'll have better luck on the next re-write.... in 10 years or so.

I have recently flown with my 2m HT in my carry on luggage.
I went from Ithaca,NY to RI through Laguardia, NYC. I had
no problem at all, and did NOT have to take it out and show
anyone. My carryons did go through the xray machine but must
have not looked suspicious enough.

This kind of thing is the prime reason that every AR Club needs to have a person assigned to their community support projects whose job it is to get media coverage (newspaper articles, pictures, and TV spots). Every mention should be clipped and saved and then when the issue comes up again, you can enter the clippings as LEGAL EVIDENCE of community support functions.

Thanks for the summary Doug!

: >In my humble opinion, I find the filter not to be very effective in
: >enhancing weak signals. It is better suited as an accessory that makes
: >"casual" listening less irritating.

: It is all a matter of physics. The Signal Quantization Ratio is the
: ratio of signal power to noise power and the higher the better.

: SQR = 1.76 + 6.02(N) - dynamic range
..
: In other words, eight bits just doesn't hack it on the ham bands.
: It is easy to see why the W9GR low-cost DSP kit doesn't work well on
: weak signals.

On weak signals, 8 bits is more than enough. It is on STRONG signals
where more bits would be useful. If your received S/N ratio is 5 or 6
dB, then the 50 dB S/N ratio of the 8-bit A/D will obviously not be
the limiting factor.

The reason the W9GR filter has little effect on noisy signals has to
do with the algorithm used and the fundamental properties of noisy
signals. Increasing the number of bits wouldn't fix it.

It has been my experience that GPS technology is STILL overpriced. The SONY PIXIS came out origianally at over $1200 two years ago, and the SAME model is now selling for around $700. (I tracked the fall last year, about $100 dollars per month in the Sporty's Pilot Catalog)

The chip that makes GPS possible in most receivers is made (I believe) by Motorola. This chip sells for around $100 (or less, depending on quantity). In theory, that price too should steadily fall since in five years, practically all automobiles will have a GPS option. (you can already get them from some manufacturers)

I do not dismiss GPS though, I want one as badly as anyone else. Not only do they tell you where you are (altitude included) but they tell you the time and date within a millisecond. Couple this to a compter and whalla, you have a mobile earth station that can track sattelites, even on the move!

An extra $0.02 worth: You do get what you pay for! The military charges (since they own the sattelites and built in a system to add noise to certain classes of signals - the ones that cheaper GPS models use)
GPS manufacuters more for increased precision
on positioning. That is why a $xx,xxx GPS receiver will spot you within a few inches, and a $1000 unit within tens of yards. But, do we really need the precision?

Jerry Pendleton (jerryp@key.amdahl.com) wrote:

: My new(?) house is 38 years old and has (mostly) two prong (no ground)
: AC-outlets.

: What is the correct (according to code) way to put in grounded plugs?

: My plan has been to run a separate bare wire from a copper stake and a
: cold water pipe to the grounding terminal on the three wire plug. Is
: this a.) a good idea, b.) legal and c.) the most efficent way to do
: it.

The ground wire should run to the service entrance fusebox, not to a
separate earth ground.

You may already have ground wires installed. My 35-year-old house uses
2-wire (no ground) wiring, but with separate ground wires connecting
all the metal outlet boxes to the service entrance. If this is the case,
and all the ground wires are connected properly, then you could install
3-wire outlets and connect the third prong to the box.

An even better solution is to run new 2-wire-plus-ground Romex.
38-year old wire is probably pretty rotten by now, so it would be a good
idea to replace it anyway.

389. ICOM IC-02E vs IC02AT fq stepsize

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-06 19:35:39 UTC
From: trond@smith.phys.ucalgary.ca
Message-ID: <Aug06.193539.24372@acs.ucalgary.ca>
Source record: 278215

Hi,

I would like to modify my ICOM IC02E into an 02AT. I know what diodes
need to be moved to obtain the 02AT frequency range (or even an expanded
frequency range). My question
is if the rearranging of diodes also will change the frequency stepsize?
The 02E has a minimum step of 12.5 kHz (only "2" (12.5kHz) and
"4" (25kHz) are possible to enter using the 'step' function on the keyboard)
so I miss many important frequencies...
I am worried that I may need a new CPU.....?

Thanks for any answer.

My Cutlass has one of the washer nozzles aimed in such a way that it shoots up over the roof instead of onto the windshield. That oughta give 'em a surprise, eh? ;^) I've been tempted to aim one *sideways*. When those tailgaters get tired of tailgating and decide to pass you, just give 'em a blast of washer fluid as they drive by! :^0

On a more serious side, it's not such a bad idea to back off if the vehicle in front of you starts spraying something all over. I had a tractor trailer spray what looked like diesel fuel all over my car on Rte. 128 near Boston once... made it nearly impossible to see where I was going. :(I did manage to make it off the road without running into anything, but I was pretty shaken up (and angry.)

Hmm, to keep this somewhat ham radio related, the car I was driving had ham plates, and I think I had a 2 meter rig with me. :^)

>and eye out for trouble and to gather help from the armed citizenry should
>the need arise. Over the years, the powers and privileges of the police
>has grown while the rights of the citizenry has been slowly stripped away.

Originally, citizens policed themselves. Each village or group of
familiies was responsible for the actions of everybody in that group.
This meant that if your neighbour did something wrong, like murder,
you were expected to take him into custody, and report him to
the local lord. The local lord would send some of his men-at-arms out,
led by the Count-of-the-stables, or Constable, and they would take
the bad guy in for trial.

Hence the term "police" for gathering or cleaning up, became used
for these constables.

If a criminal was on the run, the constable would "raise a hew-and-cry"
and the local citizenry was expected to take up arms and track down
the suspect, taking him into custody (ideally).

This worked reasonably well until about 1800 or so, when larger
urban centres became common. Criminal gangs operated in these centres
and there would be a phenomena of gangs turning each other in and
gang leaders turning in misbehaving gang members.

To control the crime in the London docks, it became necessary that an organized police force actually patrol the area. Sir Robert Peel set up the London Police in 1829 to fulfill this task. He recruited essentially big men of good character, put them in uniforms, armed them with clubs and sent them out. A patrol of large men wielding clubs, and under comparatively few rules, had a substantial deterrent effect on criminal behaviour. Taking a trouble maker into a back alley and knocking some sense in them also worked.

In case of riots, the "Bobbies" or "Peelers", had access to firearms and swords.

Montreal (or Toronto) and New York City soon followed, but with their police forces arming themselves with handguns. Getting them into uniforms took decades, however.

In any case, the role of the police started as "prisoner escort", became "patrolling security guard" and has increased from there. The job of dealing with street-crime has expanded greatly to enforcer of public morals, white-collar crime investigators, revenue enhancement, and supposedly public safety.

Whether they can, or even should, be moving into these areas is certainly a topic for debate.

DX BULLETIN 42 ARLD042
FROM ARRL HEADQUARTERS
NEWINGTON CT AUGUST 5, 1993
TO ALL RADIO AMATEURS

SB DX ARL ARLD042
ARLD042 DX NEWS

THANKS TO BOB, WB2CJL, AND THE WESTERN NEW YORK DX ASSOCIATION FOR THE ITEMS IN THIS WEEK'S BULLETIN.

ERITREA. THE E31A GROUP REMAINS VERY ACTIVE ON CW AND SSB, INCLUDING THE WARC BANDS. COMPUTER PROBLEMS HAVE HAMPERED RTTY OPERATIONS THUS FAR. A FIX IS IN THE WORKS AND THE OPERATORS HOPE TO BE RTTY-ACTIVE BY THE TIME THIS BULLETIN MAKES IT TO THE AIRWAVES. QSL VIA JH1AJT.

NORTH COOK ISLANDS. N7NKG IS ON FROM MANIHIKI ATOLL, IOTA OC-014 IN THE NORTH COOK CHAIN. HIS CALL SIGN IS ZK1XR AND CAN BE FOUND ON CW AND SSB. HE SHOULD REMAIN THERE THROUGH SEPTEMBER 4. QSL VIA N7NKG.

BELAU. MEMBERS OF THE KYOTO ARC, JAPAN, WILL OPERATE FROM AUGUST 8 THROUGH 13 ON 160 THROUGH 6 METERS WITH CW, SSB, FM AND RTTY. THE SIX METER BEACON WILL BE ON 50.130 MHZ. QSL VIA JA3OIN.

SAINT PAUL ISLAND. THREE STATIONS WILL BE ACTIVE FROM AUGUST 14 TO 18. LISTEN FOR THEM ON 160 THROUGH 10 METERS WITH CW, SSB AND POSSIBLY RTTY.

KOREA. HERE IS AN ITEM FOR PREFIX HUNTERS. HL93 IS A SPECIAL PREFIX CELEBRATING THE TAEJON INTERNATIONAL EXPOSITION. THE PREFIX WILL BE USED FROM AUGUST THROUGH NOVEMBER OF 1993. THE KOREAN AMATEUR RADIO LEAQUE, KARL, IS MAKING AN AWARD AVAILABLE FOR THOSE WHO WORK ONE OR MORE HL93 STATIONS. ALSO LISTEN FOR 6K93XPO.

MELLISH REEF UPDATE. THIS DXPEDITION IS SLATED FOR SEPTEMBER 19 THROUGH 28. THERE WILL BE TWO COMPLETELY SELF-CONTAINED OPERATING SITES, THUS ALLOWING TWO STATIONS TO BE ABLE TO WORK SIMULTANEOUSLY

ON THE SAME BAND. ARRANGEMENTS HAVE BEEN MADE FOR THE USE OF THREE GENERATORS TOTALING 10 KW OF AVAILABLE POWER. FURTHER UPDATES TO FOLLOW.

PETER ONE ISLAND. THIS 16 DAY DXPEDITION IS SCHEDULED TO BEGIN ON FEBRUARY 1, 1994. PLANS CALL FOR 10 OPERATORS, FOUR STATIONS, ALL BANDS AND MODES. RALPH, K0IR, IS LOOKING FOR AN EXPERIENCED OPERATOR. IF YOU HAVE ANY INTEREST IN THIS ONCE-IN-A-LIFETIME ADVENTURE, CONTACT HIM VIA HIS CBA.

THIS WEEKEND ON THE RADIO. THIS WEEK WE HAVE THREE OPERATING EVENTS TO ANNOUNCE.

FIRST IS THE NORTH AMERICAN QSO PARTY ON CW, SPONSORED BY THE NATIONAL CONTEST JOURNAL. THIS ONE STARTS AT 1800Z ON SATURDAY AND RUNS FOR 12 HOURS. FOR MORE DETAILS, SEE PAGE 110 OF JULY QST.

NEXT IS THE ARRL UHF CONTEST, A 24 HOUR EVENT WHICH STARTS AT 1800Z SATURDAY. RULES ET AL APPEAR ON PAGE 109 OF JULY QST.

AND LAST BUT NOT LEAST IS THE YO DX CONTEST, SPONSORED BY THE ROMANIAN AMATEUR RADIO FEDERATION, RARF. THIS 20 HOUR CONTEST STARTS AT 2000Z SATURDAY. DETAILS ARE ON PAGE 110 OF JULY QST.

Meteor shower? Wait until next year

SAN FRANCISCO -- The sky won't fall after all -- not this year, anyway.

For weeks, astronomers have excitedly awaited the Perseid meteor shower, expected to peak the night of Aug. 11-12.

Astronomy magazines forecast a "record-breaking" celestial spectacle, in which dozens or even hundreds of "shooting stars" per minute would fall into the atmosphere.

NASA scuttled a space shuttle launch for fear of meteor impacts. Thousands of ham radio operators prepared to engage in unusually long-distance chat by bouncing their signals off the meteors' ionized trails.

There's just one hitch: The big meteor shower won't happen this year. It's next August.

While the heavenly pyrotechnics should still be spectacular, recalculationsindicate Earth won't pass through the richest swarm of Perseids until August 1994, the Royal Astronomical Society in England announced in a message flashed Monday via computer networks to the world's astronomers.

"It's the Brooklyn Dodgers of meteor showers -- `Wait till next year!"' joked astronomer Steve Maran, spokesman for the American Astronomical Society.

The really big shower won't happen until August 1994, Royal Astronomical Society scientists concluded.

They used computers to analyze the motion of dust particles emitted by the Perseid shower's "parent," a comet called Swift-Tuttle, which returned to the inner solar system last September. It had last been seen during the Civil War.

Their conclusion: Earth won't pass through the densest part of the Perseid meteor cloud until a year from now.

The error isn't as dumb as it sounds. For one thing, astronomers haven't fully mapped the size and density variations of meteor clouds such as the Perseids. So it's hard to anticipate the density of the region Earth passes through.

"It's like trying to predict the weather. . . . There's always a certain amount of uncertainty," said Don Kessler of NASA's Johnson Space Center in Houston.

This year's shower will be best seen from western

Asia and Europe, says a statement by the Royal Astronomical Society.

Also, "The most intense part of the Perseid display is likely to be quite short -- an hour or less -- because the dust cloud responsible is quite compact, and the Earth will travel through it quickly."

-- Mike, N5QAW

First consider the case where the "ship" is a sailboat owned by a
private party. He needs to order a new mast and get it shipped to
Pago Pago (/KH8 for those not sure where it is ;-) This is a private
party ordering a part...no employer involved thus legal. This the
case most people where concerned about.

And per norm....the next problem .. missionaries communicating with
home base on a weekly basis...depends on what they say I suppose and
where they draw their paycheck. If the paycheck comes from the local
church is the home office their employer? Probably not. All depends
on the circumstances. Point is that things are easier than they where
as Luck pointed out.

> > stuff deleted from Luck

> the FCC to accept "K?4??? said it was OK!!" as a defense.

What Luck is saying here is that peer pressure about the general ham population considers appropriate is going to rule the day. For instance if the local repeater group still decides that ordering a pizza ain't ok they'll shut the machine off when someone trys it. This will be due to their own philosophy about what is appropriate as oppossed to the rules at this point.

>
>: My new(?) house is 38 years old and has (mostly) two prong (no ground)
>: AC-outlets.
>
Something I might do (caution, probably not code legal) is to get some
of those extension cord outlet long boxes, the sort with 6 or so 3 hole
outlets and a switch and circuit breaker/fuse. Cut off the male 3 prong
plug (leave a short useful length of wire, and put this short line cord
in your junk box). Get some heavy duty 2 prong 110v plugs, (polarized
is better)(or make it polarized by using a vise to squish the corners
of the end of one of the prongs to widen it a bit) and wire it to the
black (hot) and white (neutral, note: not the ground!) wires to it,
neutral to the wider prong if a polarized plug us used. Fold the green
ground wire back so it sticks out along side the cord out the back of
the plug. Use a crimp on connector to a heavy (#14 or thicker) wire
that runs to a good ground (copper water pipe, ground rod, or such).

Note that the existing wall plugs are the same and not removed or
changed, and that this new kludge can be unplugged like any other
extension cord. Though not a great way of doing things, it may be
less objectionable to an inspector than if you did something with
the house wiring in the walls and the wall plugs.

Do things in a careful way.

Note: proceed at your own risk. WA2ISE

405. Re: Kenwood TM-741/742 band units

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 01:34:20 UTC
From: "Terry M. Stader KA8SCP" <p00489@psilink.com>
Message-ID: <2953772858.0.p00489@psilink.com>
Source record: 278140

Monte... I have a 741 and I added 6 meters as the 3rd band. I run all seperate antennas for each band and have very good success. At times, when the air is moist.... 6 will bleed into the other bands... not sure why? The power out on 6 is pretty high and is something the service guy said to me when I took it in after the 2 meter finals failed (2 weeks BEFORE the warranty ran out!) we should be concerned about!!! The very small heatsink in these radios wil not take full power for very long. It makes sense to me... so I run my bands at either low or medium power (as we all should anyways!) all the time.

I have been thinking of going to 1200 MHz because of the increased activity here in New England... and may do that except the module is so high priced! When I was on 1200 about 5 years ago... I acheived the WWN award... (Worked Whole Neighborhood) so I sold off all but my beam... one of these days maybe get back into it.

Good luck in your decision. 6 is nice now that most everyone has cable TV!

406. SIMTEL20 archive to close?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 02:02:33 UTC
From: jfh@netcom.com
Message-ID: <jfhCBD9o9.Dn6@netcom.com>
Source record: 278139

The following posting was in another newsgroup, and may be of interest to
people who use the ham radio archives on SIMTEL20.

Newsgroups: comp.os.msdos.programmer
From: t90jwh8@mp.cs.niu.edu (Jim Huguelet)
Subject: Information About Proposed Closing of Simtel20 Archive
Date: Tue, 3 Aug 1993 00:15:48 GMT

Folks:

I'm posting the contents of a note that I found in one of the ftp directories
on wuarchive.wustl.edu, which is a mirror site for the Simtel20 archives.
The gist of the note is that the Army is currently debating whether or
not to close the Simtel20 ftp site, which has one of (if not the) largest
collections of MS-DOS related files available for anonymous ftp in the
world. If you are a user of wsmr-simtel20.army.mil or any of its
mirrors (including wuarchive, oak.oakland.edu, ftp.uu.net, and others),
this directly affects you!! Consider sending a message to the powers-
that-be (the included note tells you how and to whom) if losing Simtel20
would have an adverse impact on you or your work.

Also, please forward this posting along to others who would be affected
by this move.

-- Jim

==========

IF YOU WANT TO KEEP SIMTEL20 ALIVE AND FUNCTIONAL BEYOND SEPTEMBER *
****

The following are things that you can do:

If you are using SIMTEL20 from a University site, private site, other
government site, or anywhere EXCEPT a MILNET site:
---

1. Write *your* congressman, with copies to your state senators,
and to Senator Domenici. Senator Domenici is the Senior
Senator from New Mexico. SIMTEL20 is located at White Sands
New Mexico. Sen. Domenici did not make this decision, but he
is concerned about events that affect others' perceptions of
New Mexico and may be able to help in this matter, if asked
nicely. You might also send letters to Vice President Al Gore
and President Bill Clinton.

Pete V. Domenici Vice President Gore
U.S. Senator VICE.PRESIDENT@WHITEHOUSE.GOV
Dirksen #434
Washington D.C. 20510 President Clinton
PRESIDENT@WHITEHOUSE.GOV
or

Pete V. Domenici
U.S. Senator
Room 10013
Federal Building and US Courthouse
Albuquerque. N.M. 87102
Ph: (505) 766-3481
FAX: (505) 766-1443

Clearly state how you as an educator, student, taxpayer, businessman, etc., have used SIMTEL20 and how you have benefitted from it.

Refer only to yourself and/or your organization or company based on first-hand knowledge. Include your complete name and the name and address of your organization, as well as your e-mail address.

Do not include any second-hand information. Keep it strictly factual in a calm, rational, non-abusive tone. NO FLAMING! Flaming is not helpful in making the point.

Choose your words carefully.

2. Consider if you or your institution would pay a small fee to have access to SIMTEL20, for example, $100 per year for large Universities or companies -- say >10,000; $50 per year for smaller institutions or companies; free to K-12). If you think this is true, send a message to that effect to:

granoff@technet.nm.org

Technet, a self-funded non-profit organization, is trying to determine if it could recover its costs if it took over SIMTEL20.

3. Pass this message on to others that you think may feel the same way you do - but have not seen it.

If you are using SIMTEL20 from a MILNET site - ONLY:
---

1. Send a message to:

COL Ronald R. Boykin
505-678-1131, DSN: 258-1131
rboykin@wsmr-emh35.army.mil

COL Boykin has been told that it is not part of WSMR's
mission to continue SIMTEL20. He did not make the decision.

Clearly state how you as a military person or military
support person have used SIMTEL20 and how you have
benefitted from it.

Refer only to yourself and/or your organization or company
based on first-hand knowledge. Include your complete
organization name and address, as well as your own name and
rank/position.

Do not include any second-hand information. Keep it strictly
factual in a calm, rational, non-abusive tone. NO FLAMING!
Flaming is not helpful in making the point.

Choose your words carefully.

2. Consider if you or your organization would pay a small fee to
have access to SIMTEL20, for example, $100 per year for large
sites -- say >5,000; $50 per year for smaller sites. If
you think this is true, send a message to that effect to COL
Boykin and to:

granoff@technet.nm.org

Technet, a self-funded non-profit organization, is trying to
determine if it could recover its costs if it took over
SIMTEL20.

3. Pass this message on to others that you think may feel the
same way you do - but have not seen it.

407. Handi-Finder Kit : Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 02:13:20 UTC
From: norton@joker.optics.rochester.edu
Message-ID: <NORTON.93Aug7021320@joker.optics.rochester.edu>
Source record: 278149

Has anyone had any experience with the HandiFinder kit reported in
the May or June issue of QST? I just built the kit and had found the
audible tone, which is emitted when there is a phase difference
between the 2 antennas, is barely audible. Im not sure if this is the
norm or if a component is burned out or something.
I had heard that there was some discussion on this kit in this
group not long ago. Can anyone send me those postings?
If anyone has any experience with this kit, please respond to my
email address.
Thanx!
Scott Norton
norton@joker.optics.rochester.edu

I hate (:-) to be pedantic to Derek (especially since he was the
one who pointed out to me that Arno and Penzias are the same person :-).
But this is FUN!

It is not 500 KHz, either. It is 500 kHz. :-) :-)

Anyway, KCBS here had something this morning about the last transmission
from one of the coast guard stations (0000 UTC Saturday?). It apparently
signed with a fairwinds, then a 73 and ended (listen to this, the other
of you pedants :-) with an SK. That is right, folks, SK at the *end* of
a transmission.

KCBS played some of the Morris. (I doubt it is the real thing, since
it was only running at 10 wpm or so, plus no QRN, either.) Almost
brought tears to this person who don't exactly love cats :-).

>is if the rearranging of diodes also will change the frequency stepsize?
>The 02E has a minimum step of 12.5 kHz (only "2" (12.5kHz) and
>"4" (25kHz) are possible to enter using the 'step' function on the keyboard)
>so I miss many important frequencies...
>I am worried that I may need a new CPU.....?

Standard 02E is 12.5 kHz and 25 kHz steps only. 02A and AT are 5, 10, 15, 20, 25. 12.5 kHz step size is not used in North America to my knowledge.

CPU is the same in all models.

Diode matrix for 02E is D401 from R10 to R21, D402 from R11 to R21, D407 from R12 to R22. To keep 12.5/25 kHz spacing and enable 140-150 MHz operation, add another diode from R12 to R20. 02AT, 140-150 MHz, uses D402 as above, D403 from R12 to R20, D407A from R12 to R22 and D407B from R12 to R23. From this matrix it looks like changing the step size involves removing the diode from R10 to R21 and installing it from R12 to R23.

The manuals for these are available and have all this info in them.

>Garry Howard - KE0SH

First off, that frequency is 500 kHz, the ONLY international CW distress and calling frequency, which has been in use for over 70 years. Making a distress frequency also a calling frequency allowed ships and shore stations to monitor just one frequency. Short call were made on 500 then immediately shifted to a working freq. (425, 454, 468, 480, 512 if memory serves me correctly). And since everyone in the world was monitoring this calling frequency, no distress calls were missed. By international law, everyone DID have to monitor 500, 24 hours per day. Shipboard radiomen that wanted to get some sleep would have to turn on the Auto-alarm decoder (which automatically detects the 12 4-second dashes, 1 second between dashes, that a CW op would send prior to his SOS transmission) to wake him up if a distress message occured while he was off watch.

I spend 3 years monitoring 500 kc ('77 - '80) at the U.S. Coast Guard Radio Station, NMO, here in Honolulu (with days off, of course). 500 was very dead during daylight hours, but at night it would open up. What a joy it was to listen to ships and shore stations Pacific-wide each evening, sending traffic lists, navigation and weather warnings, position reports. But there was no joy in copying a distress message, knowing that men might be losing their lives...

Every 30 minutes, starting at minute :15 and minute :45, there was a 3-minute silent period, so as to keep a sharp listen for any weak distress signals (you'll see these two 3-minute periods marked in red on older shipboard clocks). Whoa to the unknowing ship who would so much as send a dit during that SP; he would be bombarded with remarks such as SP SP QRT, or - - . . - -, which means `lid' in the maritime radio service (a stretched out comma).

If you would like to read more about 500, I wrote an article about it in the April 1980 issue of WORLD RADIO. Also, there is a delightful book titled QTC - A SEAGOING RADIO OFFICER'S SCRAPBOOK, by an author whose pen name is only "Sparks".

Yes, it is sad to see 500 sink to a watery grave; MF maritime CW is dead. BUT HF maritime CW is still very much alive on the following bands (Gary Coffman pay attention!):

4172 - 4316 6258 - 6512 8342 - 8726 12505 - 13119 16662 - 17242

22189 - 22617 and 25071 - 25104

Oh, 8364 kHz is the HF CW distress frequency (not a calling freq, though).

73 to all of you,

Jeff, NH6IL (ex WA6QIJ)

Jeffrey Herman, University of Hawaii Mathematics, Lecturer and Ph.D. student, jherman@hawaii.edu

Well, as I pointed out last week, with maritime CW, SK (we called it VA)
is the very last item that is send at the end of a QSO.

: and BLACK = Left So if the cables are RED and BLACK then RED is Right.
: If they are BLACK and GREY then BLACK = Left. If they are SILVER and GOLD
: then I say GOLD is more like RED than SILVER is so GOLD = Right.

Funny, I always thought the Left channel should be the Lighter color.

: >turn on the brake lights without actually braking? :-)

That is exactly what I did, in order to cut off the speed control and
coast down without having to hit my brakes. But of course, I have
been known, on occasion, to hold that momentary switch down steady while
stomping in it. It's funny how I seem to put some real distance
between us that way...

From: chdaley@news.delphi.com
Message-ID: <2409bp$ikb@news.delphi.com>
Source record: 278148

I regularly carry both my HT and a scanner with me when I make a trip
out of town. Since I do not like to run these things through the
XRAY, I show them to the security personnel and demonstrate that they
do operate. So far I have encountered no problems.

One suggestion, though, especially for scanners. When you turn it on
to desplay that it is a working radio it is recommended that you lock
out those channels that might accidentally generate the "wrong" kind of
interest (police, airport security, tower freqs, etc). I usually leave the
bank of amateur freqs open and use the weather channel if someone really
wants to hear it do something.

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction to the FAQ and Amateur Radio
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

The FAQ cannot always prevent people from posting repetitive questions. But
even if hundreds of questions get posted, it saves you from having to answer
them hundreds of times. Also, a friendly pointer to the FAQ in your first
answer can help that person refer to the FAQ in the future. That is when we
can begin to get a real savings of network bandwidth.

To reduce the size of each article, the FAQ information is posted in 3 parts:
Part 1 - Introduction to the FAQ and Amateur Radio
Part 2 - Amateur Radio Organizations, Services, and Information Sources
Part 3 - Amateur Radio Advanced and Technical Questions

Table of Contents
-----------------

Part 1 - Introduction to the FAQ and Amateur Radio
** Table of Contents (6/93)
** Introduction to the FAQ (11/92)
* How to Contribute to the FAQ Articles (6/93)
* Acknowledgements (6/93)
* Notes on "Netiquette" (1/93)
```

** What is Amateur Radio? (11/92)
** Who can become a ham? (6/93)
** Where can I locate information and books on Amateur Radio? (4/92)
** How much does it cost? (4/92)
** Where can I take the tests? (pre-4/92)
** What are the tests like? (6/93)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (11/92)
** Should I build my own equipment or antenna? (11/92)

Part 2 - Amateur Radio Organizations, Services, and Information Sources
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (6/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (6/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(6/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another

country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (6/93)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** Introduction to the FAQ

* How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please
consider the following criteria:
- is it a commonly asked question?
- will its inclusion help reduce the usage of network bandwidth?
- how useful is it to beginning Hams or to the majority of Hams?
Contributions don't have to meet all of these but the minimum is one.
We actually only ask that you consider these before contributing.

We can't necessarily include every question or every topic - the
network simply doesn't have enough bandwidth to carry that much
information. Besides, the point is that we're trying to conserve
network bandwidth. You can find the locations of much more informa-
tion by referring to the "Index to the rec.radio.amateur.* Supple-
mental Archives" posted monthly by Paul Schleck KD3FU.

If you suggest a question for this FAQ, please include the answer.
You'll get credit for your contribution and you'll speed up the pro-
cess of getting the information ready for distribution.

If you feel your contribution is sufficient to meet the considerations
shown above, send it to hamradio-faq@amdahl.com so that it will
reach all the FAQ coordinators: (listed in alphabetical order)

Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)
Jack GF Hill W4PPT root@jackatak.raider.net(Brentwood, TN, USA)
Ian Kluft (editor) KD6EUI ikluft@uts.amdahl.com (San Jose, CA, USA)

Paul Schleck KD3FU pschleck@unomaha.edu (Omaha, NE, USA)
Chris Swartout N6WCP cas30@uts.amdahl.com (San Jose, CA, USA)

Steve Watt KD6GGD steve@wattres.sj.ca.us (San Jose, CA, USA)
Rosalie White WA1STO rwhite@arrl.org (Newington, CT, USA)
Derek Wills AA5BT oo7@astro.as.utexas.edu (Austin, TX, USA)

* Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Carlson KC1SP's work or her editing of a contributor's work. Diana established this FAQ and credit is due to her for founding this project.

Thanks to Devon Bowen KA2NRC for accepting this FAQ in e-mail every month to keep the FTP archive at ftp.cs.buffalo.edu up-to-date.

* Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* If you are new to UseNet, the introductory articles in news.announce.newusers are required reading. Go to that newsgroup now. Definitely, read the instructions there before posting anything. Other rec.radio.amateur.* readers will appreciate it!
* Pick the right newsgroup. Use only the most specific newsgroup for your subject. For example, a question about a homebrew antenna only needs to be posted to rec.radio.amateur.antenna. Also, don't post to rec.radio.amateur.misc when the subject can go in another rec.radio.amateur.* newsgroup.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the newsgroup. Instead, just send an e-mail message

which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* Software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aims are public service, technical training and experimentation, and communication between private persons. Amateur Radio operators are commonly called hams. Hams often communicate with each other recreationally but also provide communications for others at public events or in times of emergency or disaster.

** Who can become a ham?
The answer to this question differs in every country.

The answer for the USA is listed below. If your country has a newsgroup specifically for it (i.e. UK, Australia, Germany) the most accurate answers can be found there. See Part 2 for the list of region-specific newsgroups.

If that doesn't help, the American Radio Relay League (ARRL) may be able to help because they communicate with similar organizations in other countries, probably including yours. They can be reached by electronic mail or surface mail (see Part 2.)

In the USA, anyone who is not a representative of a foreign government can be an Amateur Radio operator. There are tests that you must pass to get a license, however the tests are not insurmountable. On that general level, the requirements are probably similar in almost every country.

For more information on becoming a Ham in the USA, the ARRL has a toll-free number where you can request information: 1-800-32-NEW-HAM (don't worry about the number being one digit too long - the phone system ignores it.) Other information

can also be obtained from the ARRL e-mail information server, detailed in Part 2.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications.

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1993); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).

* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Participate in transmitter hunt games and maybe build your own direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. A list of UseNet Elmers and their e-mail addresses is posted to the newsgroup monthly. If anyone wants to be an Elmer, send e-mail to
elmers-request@unomaha.edu

** Should I build my own equipment or antenna?
[see also rec.radio.amateur.homebrew and rec.radio.amateur.antenna]
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

Antennas can be much simpler projects than the transceiver, though some types are also quite involved. Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

When building or even understanding antennas, it is good to know the relationship between the antenna element length and the frequency or wavelength it is designed for. An antenna performs best at multiples of 1/4 of that wavelength, though 5/8 wave also has beneficial qualities. The wavelength is related to the frequency with the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

You do not need a huge antenna or tower like ones you may see around your neighborhood. Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

If you can afford new rigs and antennas, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

416. rec.radio.amateur.misc Frequently Asked Questions (Part 2 of 3)

Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
------------------------------------------------------------------------------

Questions discussed in Part 2: (dates indicate last modification)
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (6/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (6/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--

** Where can I find Ham Radio information with a computer?
This question has many answers spanning several electronic media
including UseNet, electronic mail, the Internet, dialup bulletin board
systems (BBS) and others. Various electronic information sources are
summarized under the subheadings that follow.
```

All electronic mail addresses listed are in Internet format. If your site is not connected to the Internet and does not support Internet-style mail addresses, you will need to contact either your system administrators or a local "guru" to find out how or if you can send mail to the sites listed. Ask them, "how can I get mail to the Internet?" and show them the address you're interested in.

* The rec.radio.* newsgroups
The primary distribution mechanism for this FAQ is UseNet. There are several newsgroups dealing with Amateur Radio and other aspects of radio. The full list is as follows:

rec.radio.amateur.misc (*) Ham Radio - misc/general topics
rec.radio.amateur.antenna Ham Radio - antenna construction/theory
rec.radio.amateur.equipment Ham Radio - manufactured equipment/mods
rec.radio.amateur.digital.misc Ham Radio - digital radio modes: packet/AMTOR/RTTY/etc (formerly r.r.a.packet)
rec.radio.amateur.homebrew Ham Radio - radio experimentation, kits
rec.radio.amateur.policy Ham Radio - policy & regulation
rec.radio.amateur.space Ham Radio - satellites, EME, shuttle/MIR
rec.radio.broadcasting public broadcast radio
rec.radio.cb Citizens' Band Radio
rec.radio.info (*) periodic info from all rec.radio groups
rec.radio.noncomm misc non-commercial radio topics
rec.radio.shortwave Shortwave Radio
rec.radio.swap radio equipment wanted and for sale

Country- or region-specific newsgroups include the following:
aus.radio Australia (misc radio topics)
aus.radio.amsat Australia (amateur satellites)
aus.radio.packet Australia (packet radio)
de.comm.ham Deutschland/Germany
fj.comm.ham Japan
uk.radio.amateur United Kingdom
in.ham-radio USA, Indiana
sbay.hams USA, CA, South Bay Area/Silicon Valley
triangle.radio USA, NC, Research Triangle area

This FAQ is cross-posted to the newsgroups marked with asterisks (*). It is also cross-posted to rec.answers (the archive for FAQs in the rec.* newsgroups) and to news.answers (UseNet's general repository for FAQs.) These should be the first places to look for new current copies of the FAQ.

Most of the rec.radio newsgroups have their own FAQs as well.

* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting Amateur Radio in the USA. They have established an automated file server which responds to information requests via electronic mail. To use the server, send mail to info@arrl.org with any number of one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be
appended to your message

The server program will respond to the commands, each in a separate message. Among many other informative files, a current copy of the FAQ (updated monthly) can be obtained from the ARRL e-mail server.

* The Internet File Transfer Protocol (FTP)
Sites connected to the Internet can access large amounts of data almost anywhere in the world, often at high speeds. One common way to transfer the data you want is FTP. Some sites offer a service called "anonymous FTP" which allows remote users to access a set of public files without requiring a password.

Tom Czarnik coordinates a fairly definitive list of anonymous FTP sites, their IP numbers, time zones, general contents, and access policies which he posts to the comp.misc, comp.sources.wanted, alt.sources.wanted, and news.answers newsgroups. It is itself available via anonymous FTP (how about that?? :-) from (among other places) rtfm.mit.edu (18.172.1.27) under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name, the Archie database server may be of help. First check if anyone has installed the "archie" program on your machine and use it. Archie may also be accessed by telnetting to one of the following sites (use the one closest to you):

Finland/Europe: archie.funet.fi (128.215.6.102)
Canada: archie.mcgill.ca (132.206.2.3)
Australia/New Zealand: archie.au (128.184.1.4)
Israel: cs.huji.ac.il (132.65.6.5)
UK/Ireland: raquel.doc.ic.ac.uk (146.169.11.3)
USA (Maryland): archie.sura.net (128.167.254.179)
USA (Nebraska): archie.unl.edu (129.93.1.14)
USA (New York): archie.ans.net (147.225.1.2)
USA (New Jersey): archie.rutgers.edu (128.6.18.15)

Login is archie. Type "help" at the prompt for a description of all server commands.

For those without telnet capability, the database may be accessed non-interactively via mail server. Send E-mail with the word "help" to archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are extremely powerful tools for finding out "what's out there" at various FTP sites around the world. *PLEASE* exhaust their capabilities before posting requests to the net.

The following is a brief summary of major ham-related FTP sites and
places where you can obtain a current copy of this FAQ:

ftp.cs.buffalo.edu (128.205.32.9)
(submissions to this ftp site should be made to
bowen@cs.buffalo.edu) - contains many ham radio files,
including the FAQs, Elmer list, SWL and scanner info, Packet
FAQ, examination opportunities, information on various
regulations, information on commercial radios (i.e. GE or
Motorola), SSTV (slow-scan TV), HTs (handheld transceivers)
and the KA2UGQ worldwide BBS list. See ~pub/ham-radio. This
FAQ is updated monthly here.
grivel.une.edu.au (129.180.4.7)
This site contains a mirror of ftp.cs.buffalo.edu's Ham Radio
archives. It provides a shorter distance if you're in
Australia or if Australia is a shorter net.path for you than
New York.
nic.funet.fi (128.214.6.100)
This is one of the largest FTP sites in Europe and maybe the
most popular. There are many directories of Ham-related files
in /pub/ham. /pub/ham/info contains a mirror of Buffalo.
Other topics available here include amiga, antenna, HF, packet,
satellite, scanners, program sources, VHF and others.
ftp.uu.net (137.39.1.9)
A large FTP site in the USA - UUNET contains sources and
binaries for many different types of computers.
wsmr-simtel20.army.mil (192.88.110.20)
Keith Peterson, W8SDZ, has apparently returned as the
maintainer of this huge repository of ham-radio (software and
modifications), MS-DOS, and CP/M files. To find out how
to submit files to this archive, please read his informational
posts to the comp.binaries.ibm.pc.archives newsgroup. If you
cannot directly FTP from wsmr-simtel20, there is a mail server
that can help. Send mail with the text "help" to
listserv@vm.ecs.rpi.edu (128.113.5.11).
wuarchive.wustl.edu (128.252.135.4)
A "mirror" of the files available on Simtel20, plus a *LOT*
more. A more user-friendly Unix environment (plus a faster
net connection) makes this site preferred over Simtel20.
If you are on a Unix box locally, see if your system
administrator will "NFS-mount" these files for faster/easier
access.
ucsd.edu (128.54.16.1)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
Radio-Info and TCP-Group digests.
uxc.cso.uiuc.edu (128.174.5.50)
cd pub/ham-radio - This site contains the HyperCard Hamstacks
written by Diana Carlson as well as ASCII readable ham radio

question pools.
ftp.apple.com (130.43.2.3)
cd pub/ham-radio - Ham software and information, especially
Macintosh software
wolfen.cc.uow.edu.au (130.130.68.4)
athene.uni-paderborn.de (131.234.2.32)
ham radio files and software for the Amiga computer system
rtfm.mit.edu (18.70.0.226)
cd pub/usenet/news.answers - all participating FAQs and
periodic informational postings are archived here, including
those from the rec.radio.* newsgroups which can be found in
pub/usenet/news.answers/radio. Participating FAQs are
automatically archived here when they are posted on UseNet.
ftp.amdahl.com (129.212.11.1) also called charon.amdahl.com
cd pub/radio/amateur - the most up-to-date copy of the FAQ
(updated nightly when changes are made)

If you experience difficulty connecting to the above FTP sites, some
troubleshooting hints are shown below. The unfortunate situation here
is that Netnews is far more prevalent than direct Internet hookups,
accurate name servers, smart mailers and routers, and of course,
telnet and FTP client services. What this means is that your trouble
may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line
and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If
this is the case, then you have no direct connection to the Internet
and thus cannot use real-time interactive services like FTP and
telnet.
* If you are at a college or university, your host (ie, the computer
you are logged onto) may be on the Bitnet network, which has an
email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host
have telnet and/or FTP client programs? (ie, if you type "ftp" or
"telnet" at your command prompt, do you get anything?) Many hosts,
particularly IBM mainframes not running Unix, do not support these
services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to
misconfigured connections and inaccurate host tables/name servers
(*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar
error, try telnetting via the IP number, a set of four 1-3-digit
numbers separated by periods (eg, 137.48.1.1). The exact IP number
for the site can be obtained via the nslookup utility, if your
computer supports it....or check the FAQs. Your host may not
recognize the "fully-qualified domain name" (like
callsign.cs.buffalo.edu), but it should ALWAYS recognize an IP
number if their network is reachable from yours.
* If you get "network unreachable" check with some more knowledgeable

users if your site is actually connected to the Internet. If it is,
a link in the network may be temporarily disconnected for maintenance
(or by accident.)
* In the case of telnetting to a non-default port (as in the case
with the callbook servers), if telnet <host> <port#> doesn't work,
but you can telnet to the default login port (ie, no qualifiers),
then the manner at which the port qualifier is entered may be
system dependent.
* Syntax for telnetting from different operating systems differ.
Some common command syntaxes are: (angle brackets are for
readability, do not type these in literally)
Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>
telnet <host>/<port#>
telnet <host>/port=<port#> (for Multinet on VMS)
* Compression techniques are different for different operating systems.
However, these hints should help:
foo.sit needs Macintosh UnStuffit to unstuff
foo.hqx needs Macintosh BinHex to uncompress
foo.tar needs Unix or GNU tar utility to extract archived files
foo.Z needs Unix 'uncompress' to uncompress or VMS
compress_vms.exe (on gatekeeper.dec.com) will work too.
foo.z needs the GNU gzip utility (from prep.ai.mit.edu) to
uncompress it. gzip will also uncompress *.Z files.
If more than one method was used,
like for foo.hqx.Z, start at the outside and work in (so uncompress
on Unix with 'uncompress' first, transfer to MacIntosh, then
uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software
regularly posted to comp.binaries.ibm.pc and news.answers.
* If all else fails, ASK your system administrator or check system
documentation.

* Access to FTP archives via electronic mail
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for anything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. The Archie database server may also be useful to search
for files and their directory locations on FTP sites around the world
(see below). Please be patient when using non-interactive mail
servers such as BITFTP as each request may take several hours (or
longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:

FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY
<mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS,
COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>,
QUIT, HELP. Get the help file for more information by sending mail
with the single line "help". The ftpmail site may complain if you try
try to get more than 1 file per email request. Here is an example of
a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP
mailservers, like FTPMAIL, please be considerate of any systems that
your mail must pass through. The quickest way to find yourself cut
off from the world is to make the admins of sites that pass your mail
pass 60Mb of X11 graphics system source. If you need large amounts
of information from a mailserver, contact your admin for help -- it
may already be available, or he may know a better way to get it.

* The Info-Hams mail list: rec.radio.amateur.misc by mail
You can use rec.radio.amateur.misc even if your site has no NetNews
feed. To subscribe to rec.radio.amateur.misc, send email to:
Info-Hams-Request@ucsd.edu
In the body of the message, write:
subscribe Info-Hams
If your local e-mail software does not provide a valid return address
(i.e. Bitnet, many Milnet sites, and many non-Unix e-mail packages)
you can provide your return address between the "subscribe" and the
name of the mailing list (i.e. "subscribe myname@here.org Info-Hams".)

Similarly, to subscribe to some other rec.radio.* newsgroups, use
the following directions:
* To subscribe to rec.radio.amateur.packet, send email to
Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio"
* To subscribe to rec.radio.amateur.policy, send email to
Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy"
* To subscribe to rec.radio.info, send email to

Radio-Info-Request@ucsd.edu, message is "subscribe Radio-Info"
* To subscribe to rec.radio.shortwave, send email to
listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)"

TO UNSUBSCRIBE, follow directions above, changing the command word
"subscribe" to "unsubscribe"
DON'T POST TO THE NEWSGROUP ITSELF! USE THE REQUEST ADDRESS!
Help is available by using the command word "help". Note that command
words MUST be the first word on each line of the message.

You can post to rec.radio.amateur.{misc,packet,policy} by sending
your posting email to Info-Hams, Packet-Radio, or Ham-Policy, all at
ucsd.edu. Since rec.radio.info is a moderated newsgroup, requests
to post to it may be sent to Radio-Info but they will be mailed to
the moderator, rec-radio-info@ve6mgs.ampr.ab.ca, for posting.

All of the Amateur radio newsgroups are archived for FTP on ucsd.edu
under subdirectory mailarchives/{Ham-Policy, Info-Hams,Packet-Radio}.
Radio-Info is not archived at UCSD. (See the news.answers archives
at rtfm.mit.edu.)

* Telephone BBS's with Ham-related information
WB3FFV has one, phones are 301-625-0817 or 301-625-9482 or
301-625-9663. Data settings are 8 bits, NO parity, 1 stop bit.
Login is bbs, no password.
This BBS is also available via UUCP, login is uucpanon, no password.
For a listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings
are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of
other ham-related BBS's on-line.

* Callsign servers and geographical name servers
If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10)

There is also a general geographical name server at:

martini.eecs.umich.edu (currently 141.212.100.9)

The callbook servers sit on port number 2000 and the geographical
name server sits on port 3000. These are different port numbers
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 or 3000 instead of
the default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, check the telnet/FTP troubleshooting hints above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

There is another email callsign server at callbook@n8emr.cmhnet.org. The subject line is the list of callsigns to lookup. All other lines are ignored. This same callsign server can be accessed with packet radio via cbook@n8jyv.#cmh.oh.usa.na. The body of the message should include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS, and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..." (where call1 call2 .... is space separated list of callsigns you want to lookup).

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. For Canadian calls, use the callserver at REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

The REQQTH address is for the AX.25 radio-linked amateur packet network, *NOT* the Internet. If you attempt to send Internet mail to this address, and use the old .NA suffix instead of the new .NOAM suffix, it will get routed to Nimibia (Internet suffix .na) which is currently paying a lot of money for misdirected ham mail. Help maintain a positive example for amateur radio and please do not attempt this!

The FCC "call sign hotline" at 717-337-1212 is available for those
who wish to listen to the call signs allocated in each group for each
district. This requires only a touch-tone telephone to use.

* FTP access to FCC Part 97 and FCC Amateur Radio question pools
Part 97 is part of the FCC regulations and only applies to the USA.

The text to part 97 is available by ftp from several locations:
Western US
ftp.amdahl.com /pub/radio/amateur/part97.txt.Z
Central US
pacific.mps.ohio-state.edu /msdos/ham/part97.arc
Eastern US
gandalf.umcs.maine.edu /pub/ham-radio/part97.txt
ftp.uu.net /networking/ka9q/part97.arc
The *.arc files are MSDOS ARC files with the same ASCII text.

An ASCII copy of the question pools are available by ftp from
uxc.cso.uiuc.edu (128.174.5.50) in /pub/ham-radio/<class>-pool.txt.Z,
where <class> is novice, technician, general, advanced or extra.

* Lists of radio modifications and extensions
[see also rec.radio.amateur.equipment]
Some mods can be found on wsmr-simtel20.army.mil or
the Simtel20 mirror directories on wuarchive.wustl.edu.

There is a new server at pcserver@novell.business.uwo.ca. Some
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

There is a packet radio Mods Server. To get the directories, send
a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and
that these mods are NOT guaranteed to work. This list is supplied
here because it is sometimes a frequent question on the newsgroup.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail
addresses are available from the ARRL e-mail file server in the
file called "email". See above for more information on the ARRL
e-mail server.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a concerned member (or, actually, any concerned Ham) carries a lot more weight than hearsay from any source. Their e-mail addresses are available from the ARRL e-mail file server (see above). They want direct input - that's why those addresses are available.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones (this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY 11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449, FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet 70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655. Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815, (800) 365-SUBS - lots of special interest columns, like QRP, ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 - up-to-date information on Amateur Radio happenings, including VE information and statistics

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip; do NOT affix extra postage to envelope. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST and on the ARRL e-mail server (see below); if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

Addresses for the US incoming and outgoing QSL Bureaus are available
from the ARRL e-mail server in the files called "qsl-in" and "qsl-out".
See the question above

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However,
rec.aviation.misc is appropriate for CAP aviation discussions and for
CAP radio information, these rec.radio.amateur.* groups are available.
CAP-related files are also stored on the FTP site
sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter
band. It was first conceived when propagation was poor on 10 meters,
as a method to get more hams to use 10 meters. The past few years
have been great for 10 meters worldwide. However, "the bands are
closing down" again, and 10 meters will once again be limited more
for local communications, except for sporadic band openings, until
the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call
sign, operator's name and location. Send the list to your numeric
call sign or DX area manager (as shown below), with $5.00 U.S. new
membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N3FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent
required under age 17), be a US citizen or resident alien, possess a
valid Amateur Radio license, possess a station capable of operating
on MARS HF frequencies, and be able to operate the minimum amount
of time for each quarter (12 hours for Army and Air Force; 18 hours
for Navy-Marines). Novices must upgrade to Technician within 6

months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
HQ AFC4A/SYXR
203 W. Losey St. Room 1020
Scott AFB, IL 62225-5219
(618)256-5552 Fax: (618) 256-5126

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency. The Radio Amateur Civil Emergency Service is a part of a municipal, county, or state government. This does not mean, however, that every such government has a RACES program. If your government does not have a RACES, ask them to refer you to the nearest jurisdiction that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it thru 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try the "Radio Amateurs on Usenet" listings, maintained and posted by Mark Salyzyn VE6MGS. The articles can be found monthly on rec.radio.info and rec.radio.amateur.misc. If the copy in your news spool has expired for some reason, you can look up an entry in the list by sending an e-mail to reqnet@ve6mgs.ampr.ab.ca with either of the following commands in the body of the message:
lookup keyword keyword keyword ...
return user@machine.subdomain.domain
(Fill in the proper info for the search keyword or e-mail address.)
An automated server program will reply to your message.

If you have his/her callsign or name, you should also try one of the on-line callservers shown above. This works in most cases. (!!!)

Also try directory assistance from the phone company or the locator service provided by the Salvation Army. A Salvation Army post in your local area may be able to help you. Also, the Quarter-Century Wireless Assn maintains a collection of callbooks going back to "the beginning of time". Their address is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a dial-in line for accessing new ham callsigns. Try (1-708-234-8011) at 2400 baud.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive these newsgroups as mail digests. Posting is also a one-shot thing. If you post and someone missed it, it is gone. A better way would be to announce the existence of your program here, along with information on how to obtain a copy of your program. You can also submit it to one of the FTP archive sites, which will allow the world to access it without you having to mail it to each requestor. If you just GOTTA post it somewhere, post it to more appropriate groups, like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

** Where can I get ham radio software for my computer?
Atari: John Adams KC5FW, 17106 Happy Hollow, San Antonio, TX 78232 "or tune into the weekly net Sundays 1600 UTC on 14.325 MHz".
MacIntosh: MacNet, John Seney WD1V 144 Pepperidge Dr, Manchester, NH 03103 (sent 2 800k FORMATTED diskettes, one of which contains a TEXT file containing your name, address, home PBBS, your radio & computer interests and equipment).

(See also the information about Anonymous FTP and ham-related telephone BBS's above.)

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs, hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)

Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a definitive listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above, substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
ARRL publications (i.e. conference proceedings, repeater directory) and more...

Except for the Callbook (via callsign servers), these are not available because of any of several reasons. Either there are copyright restrictions, royalty fees, or the source just may not have done the work. Also, not everyone that has information has reliable UseNet access.

In one example of someone's effort to bridge the information gap, there is a new repeater-mapping project which can automatically accept entries via e-mail. If you can get enough details about a repeater for a complete listing, you may want to help by submitting an entry. For more information, use the following e-mail addresses:

repeaters@wattres.sj.ca.us
Just send a message with only the word "help" in the message body. The project's software will reply with instructions.
steve@wattres.sj.ca.us
For other questions (Steve Watt KD6GGD)

As soon as the list is big enough to be useful, the project will make it available electronically. That will mean one less "why isn't it available electronically" question for the net.

417. rec.radio.amateur.misc Frequently Asked Questions (Part 3 of 3)

Newsgroup: rec.radio.amateur.misc

Rec.radio.amateur.misc Frequently Asked Questions
Part 3 - Amateur Radio Advanced and Technical Questions
------------------------------------------------------------------------------

Questions discussed in Part 3: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(6/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (6/93)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
```

Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician privileges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General privileges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code"
Technicians realize they can add more privileges to their license if
they learn Morse Code. The following list of suggestions should
be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever
you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character
plateau at 10 WPM by listening to the fast Farnsworth-paced
"beat" of each letter and the "beat" of common words. (See the
question on Morse code speed for more information on Farnsworth
pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters
behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test
may be in either format. (If you only practice one, you may fumble
on the other.)
* Most of all, don't give up! Recognize when you reach plateaus
and keep trying until you break through them.

** What is the standard for measuring Morse code speed?
The word PARIS was chosen as the standard length for CW code speed.
Each dit counts for one count, each dash counts for three counts,
intra-character spacing is one count, inter-character spacing is three
counts and inter-word spacing is seven counts, so the word PARIS is
exactly 50 counts:

PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation [see rec.radio.amateur.space]
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version of RTTY. Also used commercially as SITOR (Simplex Teleprinter Over Radio). [see rec.radio.amateur.digital.misc]
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for downed aircraft and missing kids and uses frequencies just outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and does not require any license to operate [see rec.radio.cb]
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used to quickly check that you have not had a "duplicate" contact with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham. Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for 24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs who provide free communications for overseas GIs and other Federal services. MARS operators are licensed under DoD instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham

OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
[see rec.radio.amateur.digital.misc]
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
[see rec.radio.amateur.digital.misc]
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
[see rec.radio.amateur.space]
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
SWL shortwave listening [see rec.radio.shortwave]
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a
reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't

do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
First, check if there is a Ham Radio-related newsgroup specific to
your country. See the country-specific newsgroups in "the rec.radio.*
newsgroups" in Part II of this FAQ.

Also, write to the ARRL and ask. They can usually tell you how to get
a license in your country.

If you know of any location where this information is available
electronically, whether by an e-mail server, anonymous FTP, or a
contact person, please mail it to us so we can include it here. Send
it to hamradio-faq@amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)?
Editor's note (11/92): the regulations affecting this question are
being changed. Contact your local Volunteer Examiner (VE) and ask
about a VE 60-day pass. More details will be included in future
revisions of the FAQ.

This paragraph is soon to be obsolete:

You need to submit a FCC Form 610-A to the FCC, PO Box 1020,
Gettysburg, PA 17326. They will then send you a reciprocal permit
for alien amateur licensee (FCC Form 610-AL). You must be a citizen
of a country with which the United States has arrangements to grant
reciprocal operating permits to visiting alien Amateur operators.

This information is still current:

For FCC licensed hams operating abroad, the following guidelines
apply:
* A reciprocal license is required in all foreign countries (that have
a reciprocal operating agreement with the US), except Canada, where
the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them
which country you are going to visit and they will send you the
info and an application form. Foreign hams can likewise request
information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur
license (ie, notarized copy), and fee if applicable (use a bank draft
of a bank that does business in that country) to the appropriate
licensing administration of the foreign country. Processing may
take 30 to 90 days.
* If less than one month, you could try sending the application and
pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment
into their country without a license or permit. If you applied, but
haven't received the permit yet, show the copy and your FCC license
to the customs officer, however, the equipment may still be held at

customs until your departure.
* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
[see also rec.radio.amateur.antenna]
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.
* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.

2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".
3. Don't be accusatory, instead ask for assistance in resolving the problem. Try to work it out with someone technically knowledgeable.
4. Do mention your "licensed radio system", but try not to be too specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** Did you know that you can get college credit for being a ham? It's true! You can receive up to 14 credits in electronics and engineering thru placement tests for CLEP (College Level Entrance Placement) exams and DANTES (Defense Activity for Non-Traditional Educational Support) exams if you have an Advanced or Extra class Amateur license. For more information, ask your campus education office or (for DANTES) your military education office.

** On what frequencies do JPL and GSFC retransmit the shuttle audio?
[see also rec.radio.amateur.space]
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840
W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN (temporarily out of service - looking for new frequency)
KA9SZX 146.88 426.25
K4GCC 146.94
WA4VME 145.17
W6TRW 145.32

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on 40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL
K4GCC - Titusville, FL (near or at Kennedy Space Center)
WA4VME - Melbourne, FL (near or at Kennedy Space Center)
W6TRW - TRW ARC, Redondo Beach, CA (shuttle audio may be overridden by repeater usage)

** Can I take my HT on an airplane and operate it if I get the permission of the captain?
Technically, maybe. But don't count on it. In general, you can't use a radio or scanner on an airline (or charter) *unless* the airline allows it and the pilot-in-command (PIC) determines that it will not interfere with the instruments and radios on that specific aircraft. Very few US airlines allow passengers to use radios so be ready to

disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the HT (or any electronic equipment) onto the airplane. Generally, you can appease the security guards, simply by showing that the unit is operational and doesn't have a bomb inside. For a radio, just turning it on and opening the squelch satisfies them. Expect more difficulty during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you have the permission of the PIC. It is still possible for the radio to interfere with the plane's navigation or communication equipment, so be sure to ask first. Always obey the requests of the PIC. He knows his airplane and radios better than you do.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location, change of name, renewal, or even change of callsign), submit an FCC Form 610 to the FCC. Forms are available from the FCC or ARRL or a local VE session or ham radio store. Do NOT use a photocopy. Check off the appropriate boxes, fill in the new/changed information, SIGN THE FORM, and attach a copy of your current license (or a brief letter of explanation for its absence, ie, "my dog ate it"). NOTE: If you check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

** I'm confused about XXX, should I ask the FCC?
[see also rec.radio.amateur.policy]
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another.

This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organization (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 - old radios, TVs, ham equipment, 40s and 50s radios, telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q, Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb, NY 14469 - sponsors the Wireless Museum

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112 (10504-524-2343)

** What do I need to get started in packet radio?
[see also rec.radio.amateur.digital.misc]
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters and 70 centimeters are most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may

need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

Your first source of information on Packet Radio should be the rec.radio.amateur.packet newsgroup. It has its own regularly-posted FAQ that goes into much more depth on the subject than this one can. See also the mailing list and archives info in Part 2.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
[see also rec.radio.amateur.space]
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington, DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV), Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted pictures. (ATV includes moving pictures and audio just like your household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (See Part 2 for more information on FTP.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

The ARRL e-mail server contains an introduction to SSTV in the file sstv-info. (See Part 2 for more information on the ARRL e-mail server.)

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?
Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for

different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day plans some weeks before the (late June) event.

418. Re: Macintosh log program?

>Mike Harpe

I run the MacHam BBS in Portland OR and have more or less every MacHam file
to ever appear on the Internet (at least that showed on and archie search every
week or so....). There are not any SUPER loggers for the Mac--I still use
paper. But the shareware and PD stuff is on my BBS (503)-656-0510. You can
try it after Sunday 8/8 (it is currently down for an overhaul).

If you prefer internet, I can send you a list of all the FTP sites that
support MacHam files. However, most of the stuff stays for a while then is
deleted so the BBS is currently better supplied than internet. I also have
some things that never made it to the internet. I have at least three loggers
you can try.

I am not aware of any commercial loggers for the Mac but WD1V might know.
If you want me to I'll dig up his internet and packet addresses for you.

good luck and 73

419. Re: Packet on Mac: Need starting advice

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 16:09:34 UTC
From: arden@techbook.techbook.com
Message-ID: <240k3u$eur@techbook.techbook.com>
Source record: 278162

phillips@nexus.CHapman.EDU (Jeff Phillips) writes:

>Greetings, Hams!

>I'm looking for advice on how to get started with Packet, using my Macintosh.
>Any advice on low cost TNC's, software?

>Anybody want to offload their old Mac Packet setup to get me started?

>Also... I heard that somewhere on the Internet there is a repository of
>Macintosh software relating to Ham Radio. Will someone please give me a
>clue as to its whereabouts?

I have two Macs on packet (and RTTY-Amtor-Radio Fax etc.). They work great with both AEA's PK232 [multimode] and PK88 [packet only]. The 88 can be had for around $100 mail order. I also hear that the Kantronics offers Mac support (I'mnot sure about the MFJ but stay away unless they have improved their line--I had many friends complain about them).

I run the MacHam BBS in Portland OR and have moe or less every MacHam file to ever appear on the Internet (at least that showed on and archie search every week or so....). There are not any SUPER loggers for the Mac--I still use paper. But the shareware and PD stuff is on my BBS (503)-656-0510. You can try it after Sunday 8/8 (it is currently down for an overhaul).

If you prefer internet to avoid long distance charges, here is a good list of MacHam FTP sites BUT my BBS has more files because I have some files that have never been on the Net etc.

The list might be valuable to other so here it is:

2301 3100 50 16% 48 139.0 71% 0.01 0.1% aus.radio

Several positive trends continue this month. Readership counts are up in all newsgroups. The newsgroup rec.radio.shortwave has surpassed rec.radio.amateur.misc, but this is probably due to the rec.radio.amateur readership spreading out among more groups. The newly-created rec.radio.amateur groups seem to have a typical (albeit low) level of propagation for the first few weeks of their lifetime (they were created at mid-month). Expectations are that they will follow roughly the same growth patterns as rec.radio.info, created last December. If these newsgroups still haven't reached your site, please ask your news administrator to create them (refer him/her to the new newsgroup announcements by Dave Lawrence in news.announce.newgroups or the messages to the new newsgroups piling up in "junk" :-). Especially point out to him/her that cost/per-reader/per-month is significantly down in all newsgroups.

Of the new rec.radio.amateur newsgroups, rec.radio.amateur.digital.misc has the lowest readership, although all are within roughly the same order of magnitude. It is expected that the rmgroup of rec.radio.amateur.packet on September 21st, combined with (we hope) the moving of the PACKET-RADIO listserv gateway (maintained by Brian Kantor, brian@ucsd.edu), will ease the transition, and allow .digital.misc to grow in readership with the other new groups. There is an RFD in the works, tentatively scheduled for January 1994, to either reconsider the rec.radio.amateur.digital.tcp-ip vote, merge all digital interests into rec.radio.amateur.digital, or possibly even revert back to rec.radio.amateur.packet. Watch news.announce.newsgroups (or subscribe to the rec.radio.amateur Working Group mailing list at rra-wg-request@amdahl.com) for further developments.

Also note that alt.radio.scanner is the fifth-largest radio newsgroup, being carried at an unusually high percentage of sites for an alt group. A vote to convert this newsgroup to rec.radio.scanner is currently in progress (conducted by Ron Dippold and the Usenet Volunteer Vote-takers). Consult alt.radio.scanner or news.announce.newgroups for more information. There are also efforts underway to create an FAQ list for this new newsgroup. Send submissions and feedback to Tom Bodoh, bodoh@dgg.cr.usgs.gov.

Note also that the defunct rec.ham-radio hierarchy reappears this month. If the newsgroups are still active at your site, please try to persuade your your news administrators to delete them as these groups have been rendered obsolete (for about 2 1/2 years now) by the rec.radio.amateur hierarchy.

Finally, aus.radio is holding on to the anchor position. There is a newly-created FAQ for the hierarchy of aus.radio newsgroups. Send submissions and feedback to Mark Cheeseman, cheese@active.asstdc.oz.au.

422. Question on Letter/Word Representations

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 17:20:42 UTC
From: shaw@aries.scs.uiuc.edu
Message-ID: <shaw.744744042@aries>
Source record: 278157

I am wondering if someone could email me a list of the words that
are used to represent letters over radio (especially by the military).
I know a few of them like T is tango, A is alpha, B is Bravo, V is victor,
and C is Charlie. I may know a few more that I cannot think of right now.

I looked all through my encyclopedia set and couldn't find anything. My
next step after this post would be to go to the library and see if I could
find a book that lists them.

If you don't have a list I would also appreciate any info you could give
me that would lead me in a library search. For instance, if they are only
used by the military or if they were started for radio communications between
airplane pilots or just simply where would be a good place to start looking!!

Thanks for any help (in advance). I really appreciate it.

Mark Shaw

>didn't electronics follow the established standard?

Standard? What Standard? Most of the world, except North America uses Brown = Hot, Blue = Neutral, Green with a yellow stripe = Ground. This is even acceptable and used on appliances in the U.S.

Now of course things have changed. I remember when in the U.K. Red = Hot, Black = Neutral, Greem = Ground. Now Sweden used to use Red = Ground. In Denmark the rule was "The wire with the "least colour" = Hot" - Yes, you figure that one out, I never could. Applying the Danish rule to U.S. wiring, which has the "least colour"? Black or white?

So, it would appear that electronics and pre 1960 British AC wiring followed the same "established standard". Why you may ask from a eurocentic viewpoint did the U.S. not follow the standard?

Is it now time to deviate this thread to the pros and cons of 220V vs 110V domestic wiring?

Kenwood TS-820S For Sale!

Digital display has been cured of it's dropout problems!

Has tube finals and driver, tubes less than 3 months old!

Has 17m transcieve capability (60 Watts CW)!

Includes crystal for 12m mod!

Has 12VDC Converter!

Recently aligned, both RF and audio-sounds great!

Has owners' and service manual, and the article with the 17m, 12m and 10m mods!

Asking $550.

Terms: UPS COD cash only, you pay shipping.

Phone 303-482-2316 or e-mail (sorry, no packet addr. at current time).

Galen Watts, KF0YJ
I reserve the right to refuse any or all offers.

> Why couldn't he have chosen the "wise" colors that most of the
> electronics industry seems to have accepted:

> Black = Ground
> Red = "hot" or "power"

Over here:

Cabling in the wall, i.e. twin & earth:
Red - Live
Black - Neutral
Copper - Earth (uninsulated, sits between the two insulated red/black).

Flex on appliances:
Brown - Live (same colour as 13A fuse)
Blue - Neutral
Green/Yellow - Earth

Now I don't quite know where Vauxhall got their wiring system from, but:
Brown - Ground
Black - +12v
Red - Ign switched +12v

Hmmm....

Message-ID: <23958@K7BUC>
From: KB7TBJ@K7BUC
To: ALL@ALLUSA
Subject: YAESU FT-530 MODS

Yaesu FT-530 Extended Transmit and Receive Mod

This modification for the Yaesu FT-530 provides extended receive coverage from 110-180 MHZ and 300-500 MHZ and expanded transmit coverage from 130-180 MHZ and 400-470 MHZ. Also, the 800 MHZ band can be received.

I have implemented this mod and it works as described.

****
Yovan Lukic, KB7TBJ
****

These are the mod instructions:

1. Remove antenna and battery

2. Remove four screws on bottom holding battery track.

3. Remove the four (black) screws holding rear case.

4. Slowly....open the front cover from transceiver and lay both halves on table.

5. Note positioning of white paper insulator in right half of radio and lift out (do not throw away).

6. Carefully locate jumper pad 13 and remove solder. The jumper pad is located on the lower right of the transceiver. There are 16 pads in all arranged in two columns. The column to the left is the even numbered column (i.e., pads 2 through 16). The column to the right is the odd numbered column (i.e., pads 1 through 15). Pad number 13 is the second pad from the bottom (counting the bottom-most pad as the first); or the seventh pad from the top (counting the top-most pad as the first).

7. Re-install white paper insulator, make sure the ground tab slides through the paper insulator.

8. Close radio back up (careful not to pinch the ribbon cable near lithium battery when closing case halves).

9. Re-install the four (black) screws holding rear case.

10. Re-install four (small silver) screws on bottom holding battery track to radio body.

11. Attach antenna and battery.

12. Turn off radio ..... Press and hold both arrow keys while turning on radio.

MODIFICATION COMPLETE

==========

Note: I haven't tried or verified this, proceed at your own risk.
And DO NOT transmit outside of legal bands! WA2ISE
We put the "N" in "Nerd"!

One good place to find these is the ARRL Operations Manual.

They are the (I believe) IARU (International Amateur Radio Union) official
Phoenetic Alphabet. The US Military uses something similar, but diferent.

Alpha
Bravo
Charlie
Delta
Echo

Uhm, I don't know Morris code or anything, but I do remember learning once
when I was a leetle child that black is the presence of all colors, and
white the absence.

Well? :)

432. Re: Micors... How to make them full duplex and retune

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-07 21:28:54 UTC
From: bote@access.digex.net
Message-ID: <2416qm$9r5@access.digex.net>
Source record: 278165

phil@hansen.ncd.com (Phil Graham) writes:
>I am looking at putting up a full duplex link between my two repeaters.
>I have no experiance with Micors...

It's a shame, what you've been missing all this time :)

Since you don't mention whether you have
a mobile or a base, I shall assume a mobile since
it is the more likely choice.

>1) How to make the Micor FULL duplex?

o Split the receive and transmit antenna ports.
The transmitter must operate through the chassis-mounted
antenna network, so we usually drill a hole in the
rear apron of the radio and mount a BNC connected
to the receiver antenna port.

o Lift one side of the diode headed to Audio/Squelch board
pin 7 to allow audio to pass during transmit.

o Connect Audio/Squelch board pin 1 to A/S board pin 4
to supply 9.6V during transmit.

>2) How big is the Micor? (I have to consider the rack space :-(

They are about 17 inches long by about 12 inches wide.
Don't you already have one?

>3) How to tune the Micor from 450-470 to 420-430? (I guess some coils need
>adjusting)

o Replace the front end coils with 420-450 split versions
for Motracs (yes, Motorola had their eyes on our band
way back then) but verify the location of the wire
taps on the input and output coils or trim the 406-420
government split coils.
There is more to this than I can go into here, right now.

o Add about 1/4 turn to each of the three injection
coils tucked into the end of the front end cavity
to allow the injection filter to tune to your
new multiplier output. Note that this will not
be necessary if you use high-side injection to
obtain a transmit-low/receive-high split for
your MICOR. You can tack-solder a short bit
of good solid wire to the end of the coils.

>4) Does it use Crystal elements or something else (raw Crystal?)?

Motorola call them "channel elements"; they are
TCXOs. Although crystal manufacturers seem to
be dropping like flies, I know for a fact
that International Crystal in 405-land knows
how to cut them. ICM part number 167908.

>5) Is there anything else I should know?

Yes, but I forgot it while I was typing #3 above.

Also, the MICOR generates its transmit frequency
by mixing the receiver injection signal with
an offset oscillator. If you end up with two
full-duplex radios, one of them must transmit
low and receive high. To accomplish this,
that radio must use a channel crystal cut
for high-side injection.

Example: to setup for 444.000 transmit and 449.000
receive, the radio would use a 16.7MC offset
oscillator, as usual. BUT, you would order
a channel crystal which is *higher* than the desired
receive frequency. The appropriate transmit
frequency is selected by tuning the exciter
filters to the required mixing product, namely
444.000MC.

Channel oscillator: 449.000 + 11.7 = 460.700MC channel xtal

Transmit frequency: 460.700 - (11.7 + transmit offset) =
460.700 - 16.7 = 444.000MC

Note that you can order a different offset oscillator
to achieve a different transmit/receive split;
it need not be stuck at 5MC, particularly if
you want to make it tougher for someone
to screw with your links.

> So, it would appear that electronics and pre 1960 British AC
>wiring followed the same "established standard". Why you may ask from
>a eurocentic viewpoint did the U.S. not follow the standard?

Simple, I guess, the US developed the standard. Wasn't Edison the first, in the world, to wire up the houses and factories?

> Is it now time to deviate this thread to the pros and cons of
>220V vs 110V domestic wiring?

This one is easy too. 220v was used to cut the cost of the copper used in wiring, transformers, and motors. The US used 110v, for residential wiring, because it wasn't quite as dangerous to human life.

Since Europe made the decision to go to 220v they have had to be extremely careful in its application. 220vac is the BEST AC voltage for accidentally killing humans. It is high enough to allow a fatal amount of current to reach the heart, and low enough that you aren't thrown free by muscle reaction. The AC makes your muscles clench up, making it impossible for you to release your grip. That is why the European wiring standards seem to be so strict.

436. INSTRUCTION/OPERATORS MANUALS up for grabs:

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-08 00:11:44 UTC
From: lockhart@mothra.nts.uci.edu
Message-ID: <2C6444C0.21277@news.service.uci.edu>
Source record: 278167
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.antenna,rec.radio.amateur.misc

I have the following INSTRUCTION/OPERATORS MANUALS up for grabs:

MAGNUM SIX RF SPEACH PROCESSOR

HY-GAIN 18HT HY-TOWER 10-80 METER

HY-GAIN THUNDERBIRD (TH3Mk30 THREE ELEMENT HAM ANTENNA

HY-GAIN BALUN MODEL No. BN-86

CDE HAM II ROTOR

COLLINS KWN-2 and KWM-2A TRANSCIEVERS

COLLINS SM-3 MICROPHONE

COLLINS 312B-4 & 312B-5 STATION CONTROLS

SPECTRONICS DD-1C DIGITAL FREQUENCY DISPLAY (used in conjunction with the COLLINS KWM2/2A
transceivers).

All INSTRUCTION/OPERATORS MANUALS are in various states of condition. Some are in good condition and some are in poor condition.

The intent is to give these INSTRUCTION/OPERATOR MANUALS to an individual or entity who ACTUALLY has the equipment.

The first person to send me e-mail gets the booty. Please send a separate e-mail request for each INSTRUCTION OR OPERATORS MANUAL. You will be asked to send a SASE (large manila or other envelope) with the appropriate amount of U.S. postage to me c/o the address in my .sig file.

For those of you who are interested, the reason these INSTRUCTION/ OPERATOR MANUALS are available is because some

$(%&*#+=$_$)* IDIOT

trashed (read distroyed) the University of California, Irvine, WB6KGN amateur radio club ham station. All of the equipment was rendered unusable. There wasn't anything to salvage (except the instruction/operator manuals. So, there you have it.

Don't be suprised if it takes me a while to get back to you. I am very busy these days. All requests will be answered.

Good luck to one and all.

73,

~jack_

You've got that backwards Joan: black is the absense of light (duh!) and thus, the absence of all colors.

I was waiting to someone to put their hand up and say
something. And Jon is right. Black is the presence of all colours when
dealing with pigments. But then white is the presence of all colours
when dealing with light.

So when they say the least colour, do they mean the least
mixtures of pigments or the most colours of the spectrum?

Still confused? I am.

441. 900 meg bandplan???

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-08 04:35:46 UTC
From: carndt@tuba.calpoly.edu
Message-ID: <1993Aug08.043546.176698@zeus.calpoly.edu>
Source record: 278174

I'm interested in amateur 900 meg activities. I use 900 at work, and would like to apply some of that hard earned knowledge off hours.

The ARRL FCC Rule Book shows the 33 cm bandplan with repeater inputs at 918-921 and outputs 12 mhz lower at 906-909.

The California 900 meg section of the ARRL Repeater Directory shows repeaters with inputs in 902, and outputs in 927, a 25 meg split. This is closer to the 24 meg split (928-952) of my commercial point-multipoint gear.

How can I find out more about this "California split"? It sure would make using some of my used commercial gear easier!

73,

Chris KD6DSI

Message-ID: <1993Aug8.001056.6098@nic.csu.net>
Source record: 278091

Somewhere I got the following posting regarding an Internet callsign server available by Telnet:

The Buckmaster CD-ROM callsign database (which includes international calls) and all the Buckmaster CD-ROM public domain files are available for retrieval!

To access the Buckmaster callsign server

rlogin/telnet: 155.212.2.2 (or, ns.risc.net)
login as: hamradio (no password)

However, when I tried it, I get a message that there is no such site. Can anyone tell me if such a service is available by Internet, that includes international calls as well as domestic ones? I already am using the one: TELNET callsign.cs.buffalo.edu 2000 with good success but that only has domestic listings.

Please send e-mail. Thanks.

I have the Icom GPS-22. It's very much better than the Sony. It
has 5 receivers rather than one time shared receiver. It acquires
and holds satellites much quicker and more reliably than the Sony.
I've held it at survey benchmarks for extended periods of time. It's
readings wander +/- 100 feet over short periods, in 2D and 3D.
That's just SA showing it's ugly face. If you average the readings
over time, it appears to be very very close to correct. I've also
compared it to my Loran unit. The Loran is only readable to 60
feet, and it's absolute accuracy can vary as much as 0.6 of a mile
depending on location, but it's extremely repeatable. More so than
the GPS for quick return to zero navigation.

What I like best about the GPS, however, is how rapidly it correctly
tracks speed over ground and course over ground. In driving around
I find it rarely lags my compass and speedometer by more than a
second. The Loran on the other hand depends on a 5 minute running
average that's essentially worthless on land.

> The Question: Has anyone out there used the Outbacker JR? What are the
> other choices? How is the performance of the Outbacker vs the others?

I have investigated HF mobile antennas as carefully as possible. My subdivision has some byzantine restrictive covents and mobile is IT for me, so I went for the best.

The Texas Bug Catcher, by GLA Systems (Henry Allen, WB5TYD and his wife Tina) is the best. Made of stainless 3/4" rod, the base is solid and virtually indestructable. The coils are awesome for construction and for inductance, the capacity hats are well-machined with no burrs and the whips are heavy duty stainless as well. NOTHING flimsey at all and Henry's antenna.

Now, the downside: you have to know something about HF antenna theory and particularly mobile applications, because Henry sells the components and you assemble them and make them work. YOU must design your antenna. No silly claims of being perfect or adjustable throughout the range of amateur frequencies. Henry's antennas really WORK. They hand soup well, and they are so damned sturdy, they hold up well, too.

The higher up from the feedpoint you place the loading coil, the better things work, but each installation is custom, and designed by the operator. One VERY loud 20meter signal comes from Jon, KC0ZFC (I may have your call wrong, Jon...sorry it was from memory and you know how that goes... ;^) who has a short Bug Catcher on his mail truck: about a two foot base stub, a huge coil, cap hat, and 4 foot whip. Jon runs a KW (solid-state) and has worked anything he can hear as he drives from Fargo to Minot each night -- he also QSLs, so ND mobile is no problem. His installation is surrounded by metal from the cab and the box. I mention this, because many people will tell you everything has to be in the clear. Probably would work better, but if it works and you're happy, ignore those who would make youunhappy by quoting theory that they do not understand (apologizies to the net wizards who *do* know ;^)...

Anyhow. I am real pleased with my installation. It is HUGE and looks most odd, especially when one considers the size of the vehicle it is

attached too! ;^)

>Is the antenna 80ft above ground level?
>
>I have wire dipole antennas for the 40m, 20m, 15m and 10m bands, above a
>building and want to know how the building affects the radiation pattern
>of the antennas.

That depends a lot on the building's construction. If it's a wooden
frame structure, it won't have a great effect on the antennas. But
if it's metal framed or metal roofed, then it certainly will have a
strong effect. You will have essentially moved the groundplane up
to 2 feet under the antenna. Note that a metal tower can be considered
a very narrow metal framed building. The effects of a tower are
real, but usually not serious. But if the tower were to be as
wide, or wider than the antenna, then the effects would be serious.
That's the case here.

This becomes complex very rapidly. Being on the building obviously
increases your line of sight radius, but that's mainly important
at VHF/UHF. It also extends the grazing distance for your lowest
angle skywave propagation. That's very good for DX. However, if
it's acting as a groundplane that near the antenna, your antenna's
vertical pattern could be badly skewed upwards so that you deliver
very little energy to that low grazing angle. And that's very bad
for DX. You may also be exciting resonances in the metal framing
of the building by such close coupling. In that case, it's anybody's
guess what your radiation pattern looks like. It might be great,
or it might be horrible. The only way to know is to measure it.

All of the above is not to say that an antenna mounted low over
a tall building roof can't be made to work effectively. You can
engineer an antenna to compensate for the effects of the building,
but this isn't a trivial task. It requires considerable calculation,
and a lot of field measurements followed by extensive cut and try
to get the pattern exactly as you want it. Using stacked elements
with differing drive currents and phases is the usual approach to
this problem.

>Oh, 8364 kHz is the HF CW distress frequency (not a calling freq, though).

The maritime service is a backward lot that's very resistant to change.
The last arc transmitter didn't leave shipboard service until WWII even
though it had been outlawed everywhere else for decades. Ship owners are
often cheap, masters conservative, and radio officers downright reactionary.
You guys remind me of John Henry racing against the steam hammer. John Henry
didn't give up until he died, but that steam hammer just kept going.

Gary

Here's what the Coast Guard release said.

U.S. COAST GUARD TO DISCONTINUE WATCHKEEPING ON THE DISTRESS
FREQUENCY 500 KHZ AND CEASE ALL MORSE CODE SERVICES

Effective August 1, 1993, all United States Coast Guard
Communication Stations and Cutters will discontinue watchkeeping on
the distress frequency 500 KHZ, and will cease all morse code
services in the medium frequency radiotelegraphy band. More
efficient telecommunication systems are now available to provide
the mariner with options for initiating or relaying distress
alerts, and passing and receiving maritime safety information.
These options include INMARSAT, Radio Telex (SITOR), MF/HF single
sideband and VHF radiotelephone, and satellite EPIRBS (for distress
alerts and telecommunications), and INMARSAT SAFETYNET, Navtex
Broadcasts include the same notices to mariners, weather, search
and rescue and fixed fishing gear location products that have been
provided by the MF morse broadcasts. Distress and other calls to
any U.S. Coast Guard Communication Station can also be made on any
of the following HF single sideband radiotelephone channels: 424
(4134 KHZ), 601 (6200 KHZ), 816 (8240 KHZ), or 1205 (12242 KHZ).
Meteorological broadcasts are also made over these channels. We
believe these options provide sufficient redundancy to ensure that
adequate distress and safety coverage. Any comments regarding this

discontinuance of MF morse telegraphy services can be sent to any Coast Guard Communications Station or direct to U.S. Coast Guard Headquarters:

Commandant (G-TTM)
U.S. Coast Guard
Washington, DC 20593
Telex: 892427 (COASTGUARDWSH)

For shame Derek, and an astronomer too. (Well maybe that explains it.)
There are two color systems, the additive one for emissive bodies, and
the subtractive one for absorptive bodies. In the former, white is the
presence of all colors, mixed in the proper ratio. In the latter, black
is the presence of all colors, mixed in the proper ratio. The latter is
the province of paints and dyes while the former is the province of
sunlight and lamps.

Chris, I have a *bunch* of Grainger and Motorola point-multipoint gear that's being pressed into data repeater service down here in the South. If I have my way, we too will adopt a California style split, though we intend to stay at 24 MHz rather than moving to 25 MHz since the gear is already set up for that. The key thing is to populate this band before we lose it, and adopting the commercial split makes that a lot easier.

>domains?
>
Electromagnetic energy (light/RF/Xrays etc.) can't be completely described
by either wave or particle models--you have to use both. However, due to
the size of radio waves typically used by most amateurs, it rarely is
necessary to use the particle model--the wave model makes more sense
for most applications. But, if you had a 1000 ft. dish handy, the photon
model would make plenty of sense, even at 80 meters (3.6 wavelengths
across--bigger than my 2 ft. dish at 1296 MHz!)

The particle model may also make sense if you want to model real
ground--ray tracing models might be a good approximation.

ZCZC AG29
QST de W1AW
ARRL Bulletin 87 ARLB087
>From ARRL Headquarters
Newington CT August 6, 1993
To all radio amateurs

The ARRL has asked the FCC to expand on a proposed rules change
regarding DATA communications on the HF bands.

In comments to the FCC filed July 30 responding to a petition filed
by the American Digital Radio Society (RM-8280), the ARRL asked that
amateur stations under automatic control be allowed to operate
outside the specific subbands proposed in an earlier ARRL proposal,
RM-8218.

Under the new proposal, stations operating outside the subbands
would be subject to three limitations: they must not be able to
initiate transmissions, they must be able to respond only to
interrogation by stations operated under local or remote control,
and they must be limited to a bandwidth of 500 hz.

In RM-8218 the League had opposed automatic control on HF bands
except in specific subbands until a plan could be developed to
minimize interference to users of other modes.

But the ARRL Board of Directors, at its July, 1993 meeting,
considered a report by its committee on amateur radio digital
communications, which suggested a way that semi-automatically
controlled data communications could be accommodated outside of the
restricted subbands. The Board agreed with the committee's
recommendation.

All interested parties will have an opportunity to comment if or
when the FCC issues a Notice of Proposed Rule Making.

More information on RM-8218 is in August QST, page 73. More
information on the Board's deliberations will appear in September
QST.

Hm... They are expensive in germany, but you can still get them,
if you want them. The ones I've seen at a friend were made by
Hitachi, you may try to phone them.

Do you _really_ need the 2114? If I were unable to find these RAMs,
I would take a little PCB, some wire and a 6116 and replace 2 (or
4 with some extra logic) 2114 with it. The 6116 is a 2 k x 8
CMOS SRAM. This trick will lower the power consumption of your
circuit too.

> laying on a shelf or in some old piece of equipment. I need 10 pieces.

My friend has about 20, but it would be too expensive to send them
to the USA.

ARRL Bulletin 86 ARLB086
>From ARRL Headquarters
Newington CT August 6, 1993
To all radio amateurs

The ARRL has filed reply comments continuing in general to support
an FCC Notice of Proposed Rule Making to define the responsibility
for the content of amateur messages relayed by high speed networks,
in PR DOCKET 93-85.

The League said that those parties who initially commented on the
NPRM generally agreed that (1) the originator and first
store-and-forward station in a DATA message network are properly
accountable for the content of a message

(2) that the originator of a message should in all cases be held
responsible for the content of a message, with the first
store-and-forward operator held responsible for either
authentication of the source of the message or the screening of
content and

(3) that the definition of repeater in the NPRM is overly
confining.

The League once again asked for the rules to include a better
definition of first forwarder, and of repeater.

More information will appear in September QST.

ARRL Bulletin 84 ARLB084
>From ARRL Headquarters
Newington CT August 6, 1993
To all radio amateurs

The FCC has fined William P. Irwin, K3CQR, $2,000. The Commission's
Vero Beach, Florida office said Irwin, 51, of De Bary, Florida, was
found causing willful and malicious interference on or near 14.313
mhz over a period of months.

Irwin, a General Class licensee, was issued a Notice of Apparent
Liability for $2,000. He was found and identified by the FCC on
July 22, 1993, while he was operating from his residence, the FCC
said in a release. The FCC inspected Irwin's station the next day.
Irwin had identified himself on the air as raincoat charlie, and
had vowed on the air that the Commission would never find him, the
FCC said.

Robert Mckinney, Engineer-in-charge at the FCC's Vero Beach office,
said some amateurs, it seems, have lost sight of the concepts 'good
amateur practice' and 'enhance international good will' enbodied in
the purpose of the service. Mr. Irwin's sole purpose for being on
the air appeared to many to be to harass and ridicule other amateurs
in a particularly vulgar way.

It is widely known, Mckinney said, that budget restraints limit
the Commission's enforcement efforts but blatant, repeated
violations such as these will not be tolerated or go unpunished.

Mckinney also said, however, that it should be pointed out that a
considerable number of concerned amateurs cooperated in the
investigation. We appreciate the efforts of these amateurs as a
community willing to take responsibility for being self-policing.

John, I had a run in with a Porsche in San Diego, I was tring to get into the on ramp lane, and no one would yield.....And the entrance was coming up quickly, So I pulled infront of a brand new Porsche...(he yielded...had something to do with the size of my Maxi-Van I think). This particular day it was raining fairly hard, and the entrance was of the 270 degree flavor so I couldn't really stand on it to get up to speed. I apparently was merging too slowly as I noticed in the mirror that he stood on it and spun an additional 270 degrees and backed in to the weeds along the side of I-8. I was quite amused by the entire event!........ps I think Shea road is as good place as any for 150 copies of the Arizona Repusive.....I mean the Arizona Republic!

Actually it is the opposite. Well, I guess it depends. White is the presence of all colors. Shine white light through a prism and you get them seperated. Black is the absence of color... night time. But a white object doesn't really have any color, since the colors of an object are actually reflected and not absorbed.

Then again, you add pigments together to be black (but in reality it turns to a muddy brown).

Just to be pedantic, the UK uses 240V..... although it appears that the Eurocrats want everyone to standardise on 230V now. Nothing wrong with having strict wiring standards either - far safer, even if you are using 110V if you know it is wired properly. But who dispensed with the safety earth? AFAIK the UK seems to be in the minority with 3-pin plugs as standard.

And yes, 240V does bite - I learned that many years ago when trying to wire my Lego motor to the mains when the batteries went flat :-)

>
>"Prohibit it?" Nah... not a chance.

Where are there any words in the new 113 that specifically allows
educational use? The ONLY mention is that teachers can be paid.
But (a)(5) still says that use on a regular basis is a no-no.
Therefore, if a teacher were to use the amateur services on a regular
basis this would clearly be precluded -- education or not.

Please quote the words in 113 that substantiate your (and apparently
the league's) position that educational use of the Amateur Radio Service
is now specifically and emphatically allowed.

I believe that you are wrong, unless there are some other words
outside of the actual 97.113 itself that has the effect of law.

As Gary KE4ZV and others point out, which is black/white and which is all/no color indeed depends on how you make the colors. Julian's original post was to the effect that the more/less color criterion is ambiguous and you gotta agree with that!

Astronomers are pretty old-fashioned, they still refer to hotter and cooler stars as 'earlier' and 'later' types, from way back when it was thought that stars start off hot and blue, and later cool down to become red ones. Heck, some of us still use Angstroms instead of these here noo-fangled nanometer thangs. What the heck do you measure with a nanometer anyway?

Some of us are so ancient, we own ink pens, harpsichords and Morris keys. We've stopped picking up ladies' handkerchiefs, though. What's a CD?

I have been reading this thread and find it amazing that so
many would do nothing with this questionable operation
on a HT. Why the ARRL didn't even take any report or question
the lady shows their lack of 'action' on possible illegal
operations.

No, I wouldn't try the citizens arrest route. But to call
the cops, take down a license plate and report it to the
local authorties/FCC wouldn't be out of line IMHO.

But the trully astonishing thread going on here that it is
'none of our business' is suprising. I guess thats why all
the lids, some with 10 years + of haming, are getting away
with crap like that on 14.300+. Some of us know these
arses and do nothing....

Part 97 is for all of us, and if we don't self-police
anarchy will rule as it slowly is creeping in on the bands
now.

I take pride in the fact that info I fed to the FCC helped
them confiscate several thousands of dollars of 11 meter
gear including amps from some local yocals. And I made sure
they knew who turned them in. Now I can operate on 10 meters
without their splatter.

: >point-multipoint gear.
: >
: >How can I find out more about this "California split"? It sure would
: >make using some of my used commercial gear easier!
:
: Chris, I have a *bunch* of Grainger and Motorola point-multipoint
: gear that's being pressed into data repeater service down here in
: the South. If I have my way, we too will adopt a California style
: split, though we intend to stay at 24 MHz rather than moving to
: 25 MHz since the gear is already set up for that. The key thing
: is to populate this band before we lose it, and adopting the
: commercial split makes that a lot easier.
:
: Gary

Here in California the Primary users of the 902 MHz band have graciously allowed us to operate in the one MHz segments on the band edges. Our band plan calls for narrow band 2.5 kHz deviation on 12.5 kHz channels. You know, we call it new technology. 902 MHz input in the quiet part of the 900 spectrum and 927 MHz output next to the high power pagers.

We are secondary users of this spectrum. The automatic vehicle location service is primary. There is a major system operating in the southern california los angeles region. Pacific Teletrak will be operating in the central valley and bay area soon.... There are others allready licenced and operating telemetry systems here in the bay area.

Pacific Teletrak a division of pac bell was out in the field quieting noisy theft alarms, located at the doors of record stores and other fine shops in southern california ;) Their attoerneys were also busy quieting those who wouldn't take no for an answer ;(Remember these guys are primary, so we must not interfere with their operations in any way.

Just below us are the Part 15 devices which can operate with up to one watt in the spread spectrum mode on 902 MHz. Good luck trying to find a one watt noise maker on your repeater input. Then try to tell the mis director that his corperate lan is getting into your amateur repeater ! I bet most of them have no clue :)

In a study here a number of years ago our Traffic Science department
discovered that traffic bunched together closely when the speeds were
more or less constant but spread out considerably when the speed
changed frequently. I have used that information to discourage tail-
gaiters by slowing down and then speeding up several times per mile.
(I Generally take my foot off the throttle until my speed drops to 5 mph
below the limit then speed up to limit+5 and repeat this process until
the tailgater drops back.) It has the benefit of using a natural tendency
and poses less risk than the other techniques. It lacks the satisfaction
of terrifying the tailgater though.

> What the phone #?

The FCC in Gettysburg can be reached at 717-337-1212. There is virtually no point to calling the FCC. When your Form 610 arrives, it is basically put on a stack of papers. After several weeks, it finally makes its way to the top, and gets processed by the computer operators/data entry people.

This occurs on a Tuesday, and your license usually shows up on the following Friday or Saturday. Yes, the tracking system stinks, and calling the above number will only serve to slow down the entire process. So as a VE, who does at least 12 tests a year, I tell people to sit tight until 90 days have passed. Then go ahead and call.

Until the FCC gets money for running ham licenses, like it does for commercial licenses, the process will be poor. And even if it did cost something, don't expect too drastic an improvement.

I completely disagree with Cecil's statements on the W9GR system and the other postings. The audio output of most transceivers, noise+interferers+ signal-of-interest is of VERY limited dynamic range. The range of signal is slid up and down by the AGC action in your receiver IF. There is quantization noise but I view it as acceptable in this system. The 50-ish dB of dynamic range in the A/D is sufficient for the applications intended.

I agree completely with Al. If the DSP used had the ummph, it could
do a Fast Kalman based RLS and do a much better job than the Widrow
type algorithm I bet it is using. I think the DSP does have the
ummph but I would have to sit down and flow chart the algorithm and
then figure out the coding before I could figure out whether or not there
exists enough instructions times per sample to do the job.

>basis this would clearly be precluded -- education or not.
>
>Please quote the words in 113 that substantiate your (and apparently
>the league's) position that educational use of the Amateur Radio Service
>is now specifically and emphatically allowed.

Amateur radio has been used as an educational adjunct for many years,
in classes on geography, social studies, languages, and of course in
science and electronics. The only problem has been that a volunteer
operator had to come in because the teacher couldn't do it while being
paid to teach. Now they can. Note carefully that 97.113(c) *assumes*
that amateur radio is usable in an educational setting since it now allows
teachers to be paid while so using it. If educational use of amateur
radio were prohibited, the Commission wouldn't have felt it necessary
to specifically OK payment of teachers to use it.

97.113(a)5 is a liberalization of previous rules required by international
treaty. In the past, amateur radio could not be used to avoid use of
other alternative radio services *at all*. Now such occasional use
is permitted in certain cases where the message content is of no
pecuniary interest to the amateur as part of his normal business
activities, or the transmissions refer to ocasional *personal*
transactions. For example, it's now OK to use amateur radio instead
of a cellphone to call a tow truck, or order a pizza. But it's still
not OK to use it as your regular dispatch system for your cab company.

This in no way prevents students from participating in amateur contacts
for educational purposes with stations in countries with which we have
third party agreements. The student has no pecuniary interest in the
contact, the foreign station has none, and now the teacher *is* permitted
to be paid by the regulations while acting as control operator for such
activities.

On the other hand, if you want to set up a packet data network for the school's normal business use, sending in daily attendance reports to the central office, arranging bus schedules, etc, in order to avoid the cost of a commercial point to point microwave system, well you're still out of luck. That's as clear a violation of 97.113(a)5 as using amateur radio to dispatch cabs.

Why should you care? That notice from an OO is still only worth the
paper it's printed on, no more. OOs have no enforcement powers. What
Steve is saying is that amateurs in your area may not mind you using
their repeaters to order pizzas while amateurs in other areas may
not permit their stations to be so used. It's local option at the
granularity level of individual repeater owners. The FCC doesn't
care anymore in either case.

Gary,
No matter how badly you want to be the net moderator, you are not so quit pretending. You seem to feel it necessary to cut down every person whom you do not agree with; you mix opinion with fact.
Have you ever been on a ship at sea? Do you know the conditions encountered onboard a ship? The humidity onboard is extremely high and salt gets in every-thing.
As much as you would like to dictate that shipboard comms should be high-tech, why not instead ask why MF and HF CW remained the major mode of comms until now?
When you are a thousand miles from the nearest radio shop and something breaks, you are expected to fix it yourself. Whatever parts you don't have onboard, have to be fabricated; you can't just yank out a board and slip in a new one. And stuff does break, believe me!
The radio officer has the responsibility of every life onboard that ship; the radio equipment was purposely kept as simple and dependable as possible.
Here's a fact that will suprise you, and you will certainly find fault with: Onbaord every Coast Guard Cutter each day at Local Apparent Noon, you will find the Captain and his quartermasters on the bridge wings `shooting the sun' with their sextents to get the noon latitude. Now ask youself why this very old-fashioned practice would still be performed when a Coast Guard Cutter should be equipted with the most modern, high-tech navigation equipment available. (Hint: same reason there is a CW hand key still sitting down below in the radioroom).

RYRYRY - GB2ATG - RYRYRYRYRY - BARTG - RYRYRYRYRY - GB2ATG - RYRYRY

This is the - British Amateur Radio Teledata Group - News Broadcast
Service for all Amateurs and Short Wave Listeners interested in RTTY
and AMTOR.

This news is broadcast during the first full week commencing Monday
each month, to the following schedule..

Evening transmissions at 1930 GMT. on 3.584 MHz. mark.
RTTY on Monday-AFSK, Wednesday-AFSK, Friday-FSK and Saturday-AFSK.
AMTOR/FEC on Tuesday and Thursday.

Morning transmission at 1000 GMT. on 7.041 MHz. mark.
RTTY on Sunday-AFSK.

Stated frequencies could be plus or minus for QRM.

News for August 1993. Bulletin No. 008. (all times are GMT).

BARTG Information.

News bulletins are now available on the Packet network as a
BARTG.GBR file thanks to Andy (G3ZYP) @ GB7BBS.#28.GBR.EU.
Bulletins are also posted on the "INTERNET" system via the INFO-HAMS
list on UCSD.EDU thanks to Iain (G6ARO) who can be contacted as
Iain@HUMBER.AC.UK
Access reports would be a welcome aid to making the news available
to all with full UK coverage on the HF and VHF bands.

BARTG rally takes place on Sunday September 12th from 10:30 (BST) at
the Sandown Exhibition Centre, Esher, Surrey. 10 minutes drive from
the M25. J10. All the latest in Data modes and computing plus Bring
and Buy. Hot and cold refreshments and BAR on site.
Volunteer stewards required, if you can help, please ring..
Rally Manager Peter Nicol (G8VXY) 021 453 2676.

Contests.

The CQ World Wide RTTY contest takes place from 0000 September 25
until 2400 September 26. on all 5 HF bands. All digital modes may be
used, Baudot, ASCII, Amtor (FEC and ARQ), Packet (no unattended
operation or contacts through Gateways or Digipeaters).
A station may only be worked once per band to score regardless of
the digital mode employed. The same station may be worked on other
bands for additional points.

Classification..
1. Single operator, all band and single band.
2. Single operator assisted.
3. Multi-operator, single transmitter.
4. Multi-operator, multi-transmitter (all band entries only).

Categories are...
A) All band.
B) Single band.
Single operator assisted and multi-operator entries can only enter
the all band section.
Total contest period is 48 hours but not more than 30 hours of
operation are permitted for single operator stations. The 18 hours
of rest can be taken at any time during the contest in periods not
less than 3 hours each which must be clearly marked in the log and
summary sheets.
Multi-operator and multi-multi stations may operate the entire 48

hours contest period.
Exchange message within the 48 continental United States is RST and state or VE area plus CQ zone number.
All other stations exchange RST and CQ zone number.
QSO points: One (1) QSO point for contacts within your own country. Two (2) QSO points for contacts outside your own country but within your own continent. Three (3) QSO points for contacts outside your own continent.
Multiplier points are: (1) point for each US state (48) and each Canadian area (13) on each band. (1) point for each DX country on each band. KH6 and KL7 count as DX countries but not states.
USA and Canada count as countries for the first contact on each band. (1) point for each CQ zone (40) on each band.
Final score: Total QSO points times total multipliers.
Logs must be post-marked no later than November 30 to qualify.
To Ron Gould, KT1N, CQ WW RTTY DX Contest Director, P.O.Box DX, Stow, MA 01775, USA.

Notes of Interest.

Belize (V3). Will be active with RTTY again as V31BR from August 9 to 16.

Saint Paul Isl. (CY9). Will be active as CY9CWA with some RTTY from August 9 to 12.

Eritrea (E3). This recently reinstated DXCC country will be activated by JH1AJT, DJ9ZB and K5VT during the first or second week in August, RTTY included. Eritrea was deleted as a separate DXCC country 14/11/1962 but is now an independent state from May 24 1993.
Penguin Isl. (ZS1). James DJ0WQ plus DK2WH, DJ4LK and DJ2ZS will sign ZS0PI from July 28 until August 4. DJ0WQ and DJ2ZS will then move to Walvis bay (ZS9) from August 6 to 28 with RTTY promised from both locations.

Pratas Isl. (BV9). Delayed operations from this new DXCC country are now expected early August. Look for BV9P.

Belau (KC6). Kyoto ARC members are mounting a major all band all mode operation including RTTY from August 8 to 13.

Anguilla (VP2E). John KA3DBN will be active on all bands as VP2EBN from August 22 to 30 with RTTY promised.

Kampuchea (XU). PA3DWC is now active as XU3DWC until he leaves in September. He has been worked on 20M. RTTY.

Thanks this month to..
G3ZYP, DXNS, VK2SG RTDX, ARRL ARLD, OPDX/BARF80.

Copy of the news as distributed by Bob G0ARF.

BARTG caters for all DATA interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers its own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk
Items for inclusion in the broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

ZCZC AG27
QST de W1AW
ARRL Bulletin 85 ARLB085
>From ARRL Headquarters
Newington CT August 6, 1993
To all radio amateurs

The FCC has extended until November 13 the comment date on a
proposal, in ET Docket 93-62, that the Commission adopt new
guidelines for evaluating the environmental effects of
radiofrequency radiation. The new guidelines would be those already
adopted by the American National Standards Institute and the
Institute of Electrical and Electronic Engineers.

The FCC said that a request for an extension of the deadline made by
the National Association of Broadcasters had been supported by a
number of other interested parties. The NAB said it asked for the
extension in order to be able to complete a study to develop
non-measurement-based techniques for complying with the FCC's
proposed new rf exposure guidelines.

The NAB said that its study would benefit both the FCC and those
whom the new guidelines would affect, by making it easier to
evaluate compliance with the new guidelines, which the NAB said are
significantly different from the old.

The original comment deadline was August 13.

: bet most of them have no clue :)

Bob, you sound almost as cynical as I'm becoming! I do have an interesting coincidence to report though.

For the last several weeks I've been seeing two new SS signals on the band up here in northern California. One was centered on about 910 MHz and 3+ MHz wide, the other was narrower and centered about 903.25 MHz. In addition to being direct sequence spread both signals were apparantly TDMA with about 4 millisecond frame time (the envelope was 4 milliseconds long with a cycle time of about 9 milliseconds). The lower signal was slopping over into the 904-905 MHz channel I am using for the higher speed digital radios I've built for the higher speed packet backbone and holding DCD open (actually square wave modulating it).

I asked around and pointed antennas toward the signals from a couple of different locations. They appeared to come from the direction of San Francisco and I thought it might be a pretty high level site. In June (on Field Day actually) I took one of my 904 MHz digital radios mobile with a meter on the C/N output to monitor the channel. What I discovered was interesting. Near many industrialized areas between Santa Rosa and San Francisco (about 60 miles distant) I found signals which were moderately strong but which showed high rate of signal strength change with distance. Just what I'd expect from low-ish power sources on omni antennas. Coming through the tunnel north of the Golden Gate Bridge and overlooking the city I saw the most sustained (versus position) signal of any location.
On returning home, I noticed another one of these "hot spots" about 5 miles from my qth approximately in the direction of SF from my place. This made me think that the new signals I'd been seeing might be pretty local.

These signals did not all appear to be the same. I didn't have a spectrum analyzer mobile but just judging from the signal strength meter, I wouldn't be surprised if some of them were frequency hopping. On some, I saw the kind of amplitude "irregularity" you might expect from a hopper.

Other than the two mountaintop radios which are beaconing, I haven't been transmitting heavily on the band. Just recently, however, I've

obtained a couple of PacComm Tiny2 TNCs with the 10 MHz option. These are intended to get the backbone temporarily into operation until the higher speed controllers can get "the last software bug" removed. The radios are capable of as high as 384 Kbps and the TNCs max out at one tenth of that but running at 38.4 Kbps is better than not running at all.
So, I started testing the TNCs/radios, first just across the bench and then driving around with one end mobile. Most of the time, I've left them beaconing with long UNPROTO paths which end up sending the maximum number of packets and excercising things. I wanted to be sure that things wouldn't break when they go up on the hill shortly. And then I noticed.... The SS signal centered at 903.25 MHz had disappeared! The other one at 910 is still running and doing it's thing.

It may be a conincidence but it also may be that the 300 watts ERP emanating from the top of my tower was an irritant to whatever was running at 903.25. Since I don't know the application or information bandwidth of the signal, I can't guess at its processing gain to know if I really presented it with a problem.

Maybe someone on the net here knows some details of these signals. I can only guess but maybe I have indirectly found a way to "adjust" the bandplans. (:>)

Hello, I am wondering how long it has been taking (5-10weeks??) to process a change of callsign for those of us with calls already. If you also know how long it's taking to process 610's for new licenses, that information will also be appreicated.

I was told by a friend that "Change of Callsigns are much faster to process because you already exsist in the database." Is this true? Does your 610 get shuffled into "the middle of the stack" when it is received by the FCC or is it sent to the back of the line with the rest of the 610's?

: were to focus on moon bounce or meteor scatter propagation, which
: do you suppose would be easier to acomplish ?

Dean,

I've done both and meteor scatter is far easier. In fact, with a low
to moderate gain antenna and 100-200 watts you may very well be able to
find enough to scatter your signal from to allow you to work "direct".
They may not be as "out of range" as you think. I've worked British
Columbia as well as Tacoma on meteor scatter more than once. I believed
I worked VE7ANP years ago on routing meteor schedules when he was
running only 100 watts.
I suspect that with high power and reasonable antennas on 6M that you
could work it pretty reliably, perhaps even all the time on SSB. The
"6M early morning crowd" has used troposcatter which is enhanced by extra
meteor activity to work up and down the west coast (at least). I don't
know if they are still active on weekend mornings or not.

Getting a station that can hear its own echos from the moon is a lot
more work (but fun).

Source record: 278118

Greetings,

From time to time I get requests to locate and make available specific programs and files from my local users. When time permits I try to accomodate these requests.

The place I look first is ucsd.edu and it a great place for packet specific stuff. MY problem is finding non-packet oriented stuff like TRKSAT24.EXE or FINDSAT.ZIP.

Can anyone suggest one or two good ham software ftp sites on the Internet?

Thanks in advance...

Well, this is going too far. You are flaming this guy with false info.

It is true that White light contains all colors of light. It is also true that absence of light will appear to the eye as black. But, light sources are not what was being discussed here. The color of an object, called wire, was the subject. Non illumenating objects get their color based on the colors of light that they absorb, and reflect.

Wire has a color because of the pigment it contains. Pigments appear to your eye to have color because they absorb all colors of light, except for those which are the pigment's color, which they reflect.

A white wire absorbs no colors, and reflects all colors. It therefore contains no pigments.

A black wire absorbs all colors, and reflects no colors. It therefore contains all pigment colors.

If you mix all primary pigment colors together, you will get a pigment that appears black, or very dark grey. This is because each component pigment absorbs all colors of light except for its primary color. When you mix them all together, you get a pigment that absorbs all colors of light, to a very large degree, and also reflects all colors of light to a very small degree. This appears to the eye as a very dark grey, or black.

Just an artist's son...

Well, since this is probably of interest to the net, I will also respond
here.

I had no problem getting into this site. Perhaps you need to talk to
your site administrator; the correct mail handling records may not
be in your system.

However, unless I did something wrong upon accessing the database, I
founbd no international records. From discussion here,
I think it unlikely there will be an online database of internationa
records as that material is collected by the publishers of the
call book; Buckmaster gets its records from the federal government.

However, I would love to be proved wrong...

I'm not sure of the distance between those two points but how about
tropo-scatter? That might be even easier for the distance involved but
I don't know if it works at VHF, I've only used it on UHF (2-4 Ghz).

>hand key still sitting down below in the radioroom).

If I were to guess, I would say nostalgea, or ignorance. Old fashioned CW radios are much less reliable than modern SSB radios. They contain more mechanical parts, more switch contacts, more sockets, and more heat. All very bad for reliability. A decent CW receiver is every bit as complicated as a SSB receiver. A microphone is easily as reliable as a key. If you don't believe me, just look at the old carbon telephone mikes.

There is some benefit to remembering the art of the sextant as a last resort, for navigation. But it is very small. Remember, sextants are delicate instruments that break too. Probably more often than GPS or Loran.

I didn't say it would get you a pink slip... I merely said that
if a repeater group decides they want to operate their machine a
certain way they will, i.e. they can be more stright laced than
rules require. Read that last sentence again Glen.

Does anyone know what the MARS frequencies are? (Please include UHF and VHF).

I picked up the following info from the FAQ Stuff.

I want to join MARS but I want to make sure I have the right equipment first.

I don't want to get into a "Catch 22" situation. :-)

>MARS Military Affiliate Radio System, military affiliated Amateurs
> who provide free communications for overseas GIs and other
> Federal services. MARS operators are licensed under DoD
> instead of FCC.
>
In all fairness doesn't the DoD give the FCC the frequencies they don't want?

I heard a rumor of a MARS operator being able to get zoning for a tower
in a community that didn't want towers. (Or antennas!)

Has anyone heard of the DoD overiding local zoning laws for a MARS operator
who wanted a tower?

>
>** How do I join MARS?

Actually, Derek is correct. In SI units (the international agreement on measurements, using meters, kilograms, and seconds--also known as the mks system), K *and* k are acceptable abbreviations for kilo.

>Anyway, KCBS here had something this morning about the last transmission
>from one of the coast guard stations (0000 UTC Saturday?). It apparently

Also, as someone is found of pointing out, the Coast Guard sends VA after the ID, but historically amateurs have sent it before (at least US amateurs in the 1930s, '40s, '50s, and '60s did).

{>arm. try this. take bug and send a string of dits. add a clothes pin
{>to the arm at the same point at the current weight. does the speed of
{>the dits change? i thought so. EOT
{
{I have tried both methods on a Les Logan bug. By adding weight I could get it
{down to about 18 WPM by doubling the length of the arm I could get it down to
{about 10 or 12 WPM and It worked pretty well.
{
{Real world trials often show flaws in theretical discussions.

This is not a flaw. The period of a gravitational pendulum is
independent of weight (well, mass) because the acceleration due to
gravity is constant. The period of a spring varies with the mass
because the _force_ is unchanged (it varies with the amount of spring
deformity, but is independent of the size of the mass), and by
Newton's second law, the acceleration varies inversely with the mass.

Lengthening the arm adds mass also, so from that alone you would
expect a slowdown. But besides that, you are turning the arm into a
lever, with the effective force now acting halfway between the pivot
and the end of the extended arm. You must now do twice the work with
the same spring to move the end of the arm twice as far, and that
would decrease the speed (halve it, I think, if the effective mass at
the end of the arm were the same as the original weight).

No flaws shown up by real world trials yet, I think.

>
>: My new(?) house is 38 years old and has (mostly) two prong (no ground)
>: AC-outlets.
>

I've got a similar situation with my 'new' 42 year old house. So I've
been contemplating selective rewiring in the house as well. Fortunately
the garage and workshop (ham shack) were wired in the '70s and are
all 3-wire. (But the polarities were reversed on about half the outlets.
I fixed that within a week of moving in... I'd recommend anyone buying an
an older house to buy a cheap polarity tester ($5.00) from any hardware
store and test all the outlets!)

My question is:

Is it legal (NEC) to simply wire the green to a cold water pipe
since the pipe is connected to the earth ground anyway?

In a book I purchased on house wiring, it mentioned this practice is OK
for *upgrades*, but not on new wiring. There are already at least two
examples of this in the house - one in the kitchen and one in the laundry
area. I plan on redoing the washing machine outlet ASAP.

BTW, on color codes, there are examples of when both black and white
are hot - this when wiring a remote switch. The book claims that one should
wrap black tape around the white wire.

Would someone please explain why a Widrow algorithm adaptive filter won't do a good job of filtering noise out of voice signals but a Fast Kalman adaptive filter will?

Also, would someone please post pointers to or info on the Fast Kalman algorithm?

Thanks in advance.

The position of the moon probably has a lot to do with it..... like if it is
below the horizon you might find moonbounce difficult :-)

If you want to try MS then I suggest 6M is a good band to look at because
even just listening to a DX beacon frequency you can hear all sorts of
meteor pings, some of which last quite a while.

From: srtest@netcom.com
Message-ID: <srtestCBIGtr.6Et@netcom.com>
Source record: 278035

I've had an FT-530 for about 5 months now, and I love it. It's feature rich and nicely designed. On audio output: it's pretty good, although not enough to fill the car over freeway noise. The audio quality is very good on both transmit and receive. On durability: I fondled all of the dual banders at HRO before I bought the '530. The ICOM w21 seemed pretty fragile. I wasn't too impressed by the Alinco. The '530, while not being commercial-football-ready seemed very solid. I grabbed the battery on each and tried to make it give. I've neard horror stories about the ICOMs and loose batteries. The '530 battery didn't even budge. I'm not sure I'll take it skiing, however. I'll keep my IC2AT for that. On intermod: yes, it does suffer, especially here in Silicon-high-RF-Valley. The Yaesu factory mod and the new antenna helped quite a bit, though. My Bearcat scanner is worse. On the remote microphone: it's great! Really makes using the radio easy. On battery life: the pulsed receiver definitely stretches life out of the cells. I use the 1200 mAh batteries; they last several days of light transmitting and heavy monitoring. Note that there are several power settings for the trasmitter per band, another nice battery saver. Lastly, on Yaesu service: excellent. I wish the manual were a little better written, however.

If I were going to buy another (amateur) handheld: FT-530. I wish they'd beef up their amateur handhelds and add some commercial-quality filtering. But then again, the new Yaesu commercial dual-bander is twice the price.

508. Theory Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-09 21:35:59 UTC
From: Charles.R.Hohenstein.1@nd.edu
Message-ID: <Charles.R.Hohenstein.1-090893161651@mac03.hesburgh.lab.nd.edu>
Source record: 278036

I hope this will not be an ignorant question, but I don't remember seeing it addressed anywhere in the license study books:

As we all know, RF energy is part of the electromagnetic spectrum, which includes light (not to mention gamma rays, etc.). This seems to be the same as saying that RF and light are "the same thing"--i.e. electromagnetic radiation--but within two different ranges of wavelength. But if they are both different wavelengths of the "same" radiation, why is it that light is said to involve the transmission of particles (photons), while radio waves (as far as I know) are not? Is it the case that photons are actually present below the part of the spectrum involving light, but in such negligible quantities that we never refer to them? Isn't it true that as radio waves (especially microwaves) approach infrared wavelengths, they begin to acquire characteristics increasingly similar to light (for example, focused by parabolic "mirror" antennas)? Do photons begin to appear all at once when the wavelength shortens into the visible light region of the spectrum, or were they there all along in the RF and infrared domains?

Which band's intermod does the factory mod purport to fix? Did they say
what they did, or did they just say "it's better now"?

Does anyone have a phone number (business number) for AA1A as in AA1A antennas? They advertise in the usual magazines on a sporadic basis however I haven't been able to find an ad lately and am in desperate need of some more hardware :-)

Thanks,

Here is some gud advice. But I think that the Kantronics KPC 3
would be better than the PK88. Thats just an opinion. The KPC 3 is 100 dollars
and has the following features:

32K Std Memory
Personal Mail BBS
Kantronics KA-Node
Packet, WEFAX
Operates in std, host and KISS modes!

Its easy to hookup to a mac. If u want pin config., ask me.
Also easy to hookup to radio!

Radio waves can also be defined in terms of photons but just much less
energetic ones. The other point is that you won't nominally notice
the quantum, i.e. photon behavior of radio waves (especially in the
HF wavelengths ;-) under normal circumstances. There is a "duality"
concept involved here. You can get an propagating wavefront to exhibit
behavior as a wave or as photons, i.e. particles..but you won't see
both behaviors at the same time. (Anyone want to correct me on this..
it's been ALONG time since I've taken any quantum physics courses.

> to acomplish ?

glenne@sad.hp.com (Glenn Elmore) replies:

> I've done both and meteor scatter is far easier.

It sounds like Dean is looking for a reliable path, and Glenn recommends meteor scatter, which surprised me. I had the impression that meteor scatter was a very occasional thing, like when the Persieds or Leonids were in town. Is this not the case? If I were to work nothing other than meteor scatter, how many hours would I be able to work during and "average" week? Glenn continues:

> The "6M early morning crowd" has used troposcatter which is enhanced
> by extra meteor activity to work up and down the west coast

Troposcatter? Is this what happens when little bits of tropo re-enter the atmosphere? (:^) Seriously, this is a new term to me. Are troposcatter and troposheric ducting related? How about sporadic E? As I recall from junior high school science class, the troposephere is the lowest layer of the atmosphere. I also seem recall reading that the curent theory about the source of sporadic E skip is clouds of ionized particles produced when two large air masses rub against one another during wind shear conditions. Is this the same as troposcatter? Is it also more common than I expect? From Glenn's description of the 6M crowd, it would appear so.

> Kinda kills the brushes, though :(
>
Well I was probably about 7 years old at the time and I didn't have a 12V battery to hand..... I also didn't understand the difference between AC and DC either, so the mains probably wouldn't have worked even if I had managed to connect it to the motor instead of to me :-)

My father used to let me wire mains plugs at the time (under supervision) but I think he would have been horrified to discover that I had 'graduated' to trying things out by myself.

C14 is the .001K; K is tolerance, Y5P is the dielectric type
C7 is the 104; in this format the three digits are like color code...
1, 0 then four 0's = 100000 pF = 100 nF = 0.1 uF

>were to focus on moon bounce or meteor scatter propagation, which
>do you suppose would be easier to acomplish ?

To make it on 2m EME you should have something like 4 yagis and 1kW
at both ends. Unless you have this kind of stations meteor scatter will
be easier providing that the distance is less than about 1400 miles. About
100W and one yagi should do it. Easiest distance is around 900 miles.
On 70cm meteor scatter is very difficult and i think EME would be easier
but you would again need at least 4 yagis and high power. No experience on
220 MHz since we don't have that band in Europe.

I am trying to choose a smart antenna setup to run HF mobile
from my Chevy Astro van. I am looking for advice on mounting
possibilities (bumper, roof, side, etc.) Is the sheet-metal
of the car strong enough to hold a mobile HF antenna? What
about if it's mounted on the side of the car, through
the sheet-metal? How high does it need to be? above the
ground or the top of the car? Do masts help?
What are the recommended commericial antennas? Anyone
have advice on the Ham Sticks? Outbacker? Texas Bug Catcher?
Any Others?
Any minimums for coax quality? Even radio mounting suggestions
for my FT757.
A lot of questions, I realize. Thanks!

523. Alinco DR-130T 2m/mobile rig

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-10 09:11:42 UTC
From: jeff@nraven.wariat.org
Message-ID: <8D828B2w165w@nraven.wariat.org>
Source record: 278015

Hellow everyone, i recently purchased an alinco
DR-130T mobile from HRO, and so far i like it. But unfortunatly
i found a flaw in it.. Atleast i think its a flaw, because what
i have to do to get around what another button could do, can cause
a nasty car accident =)...

What i'm talkin about is using the radio without a duplex seting. I want
to be able to use it simplex sometimes, since it is 50watts. But
the radio, and instruction book have not shown me any way of setting
it like this. The only way i found i can create a simplex setup is
if i press the Func key, chose "shift" (offset) and set it to 00..
Now going down the road at 55, this can cause a nasty accident.
Am i wrong in thinking there should be a way to set your radio
to neither negative, or positive duplex? if i'm wrong i'd
gladly accept your insults ;) But if i'm correct, what should
i do about this? Call alinco? If i'm missing something, like
5 pages of my manual (i check the numbers, i doubt it) that
might tell me something like this, i'd appreciate any other
experiences. Thanks much..

Jeff Garvas, N8YNR

Source record: 278065

In my (modest) book collection of antennas I can't find any reference to phased verticals using more than 2 verticals in the system. My (ancient) ARRL antenna book shows the set-up for two to produce a bi or uni directional pattern, the latter by feeding one vertical 90 degrees out of phase with the other.
I would appreciate any info on using more than two vertical, (3, 4 or even 5), with details of phasing to produce a switchable, uni-directional array so as to cover much of the main areas of the globe.
Please either mail me direct or to the newsgroup if you think the info would be of interest to others.

TNX and 73...Peter, G4BVH.

Anybody down there in the Raleigh-Durham-Wilmington-Wilson, NC area ever heard of WRDU, 106.1 FM?

Funny, but I was listening to them talk about I-64 this morning, and mention the fact that several people had called, saying that the station was being heard first in Richmond, and then in the DC area.

A distance of over 300 miles, full quieting. Given the weather patterns over the last few days, a colleague here and I guessed Tropo ducting as opposed to E-skip. Any other ideas?

I live about halfway between DC and Baltimore.

I used to do repairs on ships putting in at Savannah, mostly radar, but some comm and nav stuff too. Spares are supposed to be kept on board for critical equipment, and they were, but it seemed that most ROs didn't know a PFN from a maggie. And when they saw a log amp they tried to throw it overboard and time it's drift. I guess if they couldn't find the jack to plug in their straight keys they were lost.

(To be fair, not all ROs were backward, many were sharp techs in their own right. But one got the impression that a good number would be doing well to handle a fuse change despite their obvious Morse superiority.)

> Here's a fact that will suprise you, and you will certainly find fault

>tech navigation equipment available. (Hint: same reason there is a CW
>hand key still sitting down below in the radioroom).

Tradition? Sort of like the rituals for crossing the equator I guess.
Or maybe it's because the Captain doesn't trust the RO to keep the
GPS, Loran, Omega, Glosnass, and radar systems running with that straight
key. I bet he doesn't trust the RO to wind the chronometer with his
straight key either. :-)

(I do understand belt and suspenders methods. Keeping in practice for
the time it might be necessary to navigate a lifeboat makes some sense.
Though the probability of rescuing the ephemeris and chronometer as
well as the sextant during an abandon ship is probably slight. But
maintaining Morse proficiency with all the redundant communications
available makes less sense than shooting the sun at noon. It's sort of
like keeping an old spark gap around just in case all the tubes and
transistors get broken.)

>domains?

Oh, quantum physics. All electromagnetic radiation is both wave like
and particle like. As frequency decreases, quantum energy decreases,
and individual energy packets, photons, become increasingly harder
to measure, but they're still there. It's just easier to deal with
them as a wave. When frequency increases, packet energy increases,
and it's easier to treat them as particle like entities. Whether
you treat a given signal as wave like or particle like depends on
the nature of the apparatus you use to measure it. The nature of
a lens requires light to behave in a wave like manner while the
nature of a photocell requires it to behave as a particle. But
the wave/particle duality is there in both cases. It's just that
you've arranged the apparatus to measure one or the other. One
of the quirks of quantum mechanics is that you can't measure
both at the same time.

A white wire absorbs no colors, and reflects all colors. It therefore contains no pigments.

Bull, anybody who ever worked with paint knows the falacy in this. White does contain pigments. An ideal medium is transparent, in neither reflects nor absorbs anything. You need a pigment even to make white (unless you wanted clear).

This appears to the eye as a very dark grey, or black.

Pigments aren't perfect.

Actually as someone else pointed out, mixing the primary pigments usually yields a crappy brown color. That's why most printing processes use four colors, the three primaries plus black.

Well, for my 0.02 worth I think that that really would be a good application
of DSP - to try and bring the signal out of the noise. This would be especially
good if it could cope with signals that have been scattered and have
varying phase/amplitude.

ARES is a function of the ARRL.
RACES isn't. It is sanctioned and maintained by the US Gummint. Under
what used to be called Civil Defense, now FEMA.

(Gad, I hope I'm right about that!)

In many communities Races and ARES have combined. If, under an emergency,
such as the dreaded !!!NUCLEAR ATTACK!!!, amateurs will not be able to
operate, ARES will be dead (maybe so will everyone else), but RACES may
still function under FEMA.

At least that's the way our local RACES guru explained it to me a while
back.

I'm anxiously waiting to hear better responses than this. HI.

: >

: My question is:

: Is it legal (NEC) to simply wire the green to a cold water pipe
: since the pipe is connected to the earth ground anyway?

: In a book I purchased on house wiring, it mentioned this practice is OK
: for *upgrades*, but not on new wiring. There are already at least two :
examples of this in the house - one in the kitchen and one in the laundry
: area. I plan on redoing the washing machine outlet ASAP.

If at all possible run a new three conductor cable, far, far safer
and it gives you a better ground. Do not be so sure that the water pipe
is actually grounded. In some places the fresh water pipes are
deliberately insulated from ground by a hunk of plastic pipe near the
water meter. Some people maintain that this is a good method of corrosion
control for the piping. Varies by the local building code.

: BTW, on color codes, there are examples of when both black and white :
are hot - this when wiring a remote switch. The book claims that one
should : wrap black tape around the white wire.

That is the only time when white or grey can be energized. The
white is supposed to be between the switch and the load only.

How about this for ending confusion . . .

Most household-diameter wires (i.e. 10, 12, and 14 ga) are large
enough to be marked with LETTERING; many wires have the manufacturer
name, gauge, #strands (on stranded wire), temperature rating, and
insulation breakdown voltage. Why not add the words "HOT HOT HOT" on
the Black wires, "NEUTRAL NEUTRAL NEUTRAL" on the White wires, and
"GND GND GND" on the Green wires? Why not just make all the wires
white and print the appropriate word along it's length (this is
probably pushing it). This would help the color-blind, and end
confusion of "weekend wirerers" like myself.

>dr krishna s. sampath...senior research associate...kss@lenz.eng.ohio-state.edu

To answer you in a straight forward manner...yes. ;-)

The difference is that the ARES or "Amateur Radio Emergency Service" is a
program sponsored by the American Radio Relay League (ARRL) as part of the
ARRL field organization. RACES or the "Radio Amateur Civil Emergency Service"
is an FCC radio service composed of Amateur Radio Operators and is defined
as a service within the Part 97 rules that govern amateur radio. So that
is where the two terms come from.

Now, RACES is limited by definition within Part 97 to be an amateur radio
auxiliary communications service available to government entities during
troubled times(be it civil disturbances, war, natural disasters, etc.)
The ARES isn't so limited since it is sponsored by a private organization.
ARES can respond to either government callup or requests made by the
local church to help organize comm for a parade they are sponsoring. The
RACES rules have liberalized slightly in the last couple years(Part 97
rewrite of 1989) but RACES groups are still highly limited in the time
they are allowed to practice as an organized group, and in who they
can talk too during a state of emergency. ARES doesn't have any such
limitiation. The best of both worlds is when an ARES group also wears
the RACES hat in a given jurisdiction. This gives the most amount of
latitude as to how they respond. As an example, in Santa Clara County
where I live the two groups are combined by resolution of the county
board of supervisors! RACES/ARES has the mission within in this county
to handle communicatios to shelters. You might even think of it as a
formal contract between the RACES group and the county. Amateurs
do shelter comm here. Mind you we do other stuff as well, but within
the emergency plan at the county/city level this is our prime mission.
So the county includes us in all planning for drills because we are
considered an integral part of how they do business in times of emergency.

Hope this all helps.

Steve KA6S

> When all else fails I use labels :-)
>
> ===
> Pete Rossi - WA3NNA rossi@VFL.Paramax.COM

I also use "Red" = Right (as do most of the equipment manufacturers I've stumbled across).

When connecting "zip-cord" speaker wire (i.e. Radio Shack "clear" speaker wire) one of the wires is "tinned" (or somehow made to look "silver" in color, compared to "copper" in color) for traceability. I always use "Silver" = "Signal", by default the other one is "ground".

Here's a good one . . . I have a 4-gang phone patch cord with "Black", "Red", "Yellow", and "Green" connectors. Good use is tape-deck to main stereo (2 for stereo->deck 2 for deck<-stereo). In an instance like this, I opted for LABELS !

mohan@tulip (Mohan Pakkurti) writes:
>The Antenna Handbook and some other antenna books say that an antenna has to be
>atleast 1/2 lambda above ground level to have good radiation pattern.
>Now, if my simple dipole antenna is 2 ft above the roof of building 80 ft high,
>Is the antenna 80ft above ground level?

What they mean by "ground level" is the location of RADIO ground,
which may be at ground level, several feet underground, or in the
case of your building, 80 feet above ground. I assume that a building
that high is made primarily of steel, which means that it probably
acts as a ground plane. The ARRL Antenna Handbook explains
the concept of radio ground.

>I have wire dipole antennas for the 40m, 20m, 15m and 10m bands, above a
>building and want to know how the building affects the radiation pattern
>of the antennas.

It undoubtedly affects the radiation pattern, but it's difficult to
tell exactly how.

If I were you, I would experiment a bit. How are your antennas
working now? If you are not happy with their performance,
you may want to try a couple of things. Install one as a
"sloper" (one end higher than the other) or even a vertical
and see what happens. A vertical may work well, since your
building probably provides a nice ground plane. Another thing
to try is a loop around the building fed with ladder line
(parallel line) and an antenna tuner; in my experience, a loop
like this works better than a dipole when you can't get
the antenna very far above radio ground, and a loop of
around 70 feet of wire should work on all the HF bands if
you use an antenna tuner.

>how many hours would I be able to work during and "average" week?

Well, now that all depends on a number of factors. If you rely on shower
meteors (known in the MBC world as "overdense"), then you're correct, the
time between pings is quite long. Most MBC systems, however, rely on
underdense meteors, which are the result of collisions with cosmic dust, and
which are far more frequent (10^14 per day). The exact equations are in
the CCIR Green Books.

"(97.209a) Any amateur station may be an Earth station. A holder of any class operator license may be the control operator of an Earth station, subject to the privileges of the class of operator license held by the control operator."

Earth stations subbands are listed in 97.209b.

If you can transmit on the right frequency, you can work space stations.

: I've got a similar situation with my 'new' 42 year old house. ...

: My question is:

: Is it legal (NEC) to simply wire the green to a cold water pipe
: since the pipe is connected to the earth ground anyway?

I don't know if it's legal, but it is a bad idea. All the safety grounds in the house, and all the metal plumbing, should be wired to the same point: the breaker box ground at the service entrance. If several different "grounds" exist, you can get zapped if one of the grounds opens up and develops a dangerous voltage.

That's exactly what happened to me at my house. In the "new" addition (done 20 years ago), the drain in the shower was connected to earth ground instead of the house wiring ground. The rest of the plumbing system was connected to house wiring ground. I was getting zapped every time I touched the shower head while standing on the drain. To make a long story short, the problem was a defective well pump AT MY NEIGHBOR's HOUSE! The problem didn't even go away when I pulled the main breaker at my house! The voltage between the two "grounds" was about 60 V open circuit with about 6 Amps short-circuit current. More than enough to kill!

My father (Jim Tolar) was a very active Ham for most of his adult life. He passed away a couple of years ago, and I would like to get ahold of an old QSL card of his. He sent these things all over the world, and it seemed (when I was young) that you couldn't take two steps in any direction without tripping over them. Now, all of a sudden, none remain. He was most active during the 1950-1972 time-frame. His home base was Hoopeston Ill. and Cleveland Ohio. Anyone that has one of his QSL cards and is w

illing to part with it, please contact me via E-mail.

Thanks, and apologies for reducing the signal to noise ratio of the newsgroup.

Jim Tolar

Here's a brief summary of what RACES is taken from a FEMA/FCC brochure that I was given from our county civil defense office:

<begin text>

L-136/July 1983 State and Local Direction and Control RACES
FEMA/FCC

WHAT IS RACES? Radio Amateur Civil Emergency Service (RACES) provides for amateur radio operation for emergency communications purposes only, during periods of local, regional, or national emergencies. RACES is an essential link to help warn people about disasters.

RACES NETWORKS Every RACES station is a part of one or more emergency communications networks. These networks provide vital communication for:
* Local government emergency operating centers
* State government emergency operating centers
* Remote locations

All communications in RACES must be specifically authorized by the civil defense organization for the area served.

WHEN IS RACES NEEDED? The RACES organization of amateur radio operators is vital during such emergencies as:
* National Disasters * Tornadoes *Hurricanes * Earthquakes
* Nuclear Accidents * Floods *Blackouts * Bomb Threats

Frequently, normal communication systems sustain damage during these types of emergencies. It is then that RACES operators are invaluable to emergency managers.

During national emergencies, RACES operators are the only amateur radio operators permitted on the air. In an emergency, RACES operators are assigned specific frequencies within authorized frequency bands as directed by emergency management officials.

FEMA's State and Local Direction and Control Program provides support to State and local governments and Emergency Broadcast System stations through the following elements:
* Emergency Operating Centers (EOC) program
* Warning and Communications Systems (WCS) program
* Broadcast Station Protection Program (BSPP)
* Emergency Broadcast System (EBS) Operational Area Planning
* Electromagnetic Pulse (EMP) Technical Support program

For more information on RACES contact your State Emergency Management Office, The Federal Emergency Management Agency, or the Federal Communications

Commission.

<end of text>

Well, there you have it straight from the horse's mouth. Keep in mind that this brochure is dated 1983. Now, it's the ARRL's turn to summarize what ARES is all about.

I suggest you take a look at the "four-square" array. It's a square,
unidirectional array switchable in four directions. Info on the feed
system and directional switching schemes can be found in chapter 8
of the ARRL Antenna Book, 15th ed. or later. An alternative feed system
is described in "The Simplest Phased Array Feed System - That Works" in
the ARRL Antenna Compendium, Volume 2.

> be more advantageous to have a single orgnanization?
>

It sure WOULD be more advantageous, Krishna. Which is why we strive
mightily to suggest that very notion, every time we get a chance.

Some states, fortunately, have figured out why the public is served
poorly by sporadic implementations of RACES, when very capable networks
of ARES operators and equipment already exist. Florida, for example,
has finally come around, due to the extremely poor showing of RACES
during and in the aftermath of Hurricane Andrew.

Virginia has, for quite close to two decades now, clearly understood
why having ARES and RACES be one and the same organization is a brilliant
move. In fact, in Virginia, the ARRL Section Emergency Coordinator is
also the State RACES Radio Officer. And that's with the understanding
of the Governor of Virginia.

But most important of all, in states where ARES and RACES has been
combined into one functioning organization, there's VERY little chance
for a disaster -- large or small -- to result in a served agency not
knowing who to turn to when the communications chips are really down.

You've nailed it right square on the head. But there's an additional
point that ought to be made:

ARES serves the emergency communications needs of any person, organization,
or group which will plan with the ARES folks in advance, so that both the
ARES teams and the people being served will understand -- in advance --
what the game plan is.

RACES on the other hand is tasked with serving only the needs of the
government. And that's by design of both Part 97 regulations and the
government itself.

Which is why making use of the far more flexible ARES program is much
more logical. And it's clearly why served agencies nationwide (and
state goverments to boot) are gradually seeing the light.

I would certainly HOPE so, given that I work satellites every day, with
privileges that are granted to Technician class licensees.

Next time some joker tries to tell you that Amateur Radio satellite
operation is off-limits to anyone holding a Technician class license,
you should ask him to back up his allegation by pointing to the specific
Part 97 rule that forbids it. Just don't hold your breath.

Thomas Collins WI3P (collinst@esvx19.es.dupont.com) wrote:
: I have been reading this thread and find it amazing that so
: many would do nothing with this questionable operation
: on a HT. Why the ARRL didn't even take any report or question
: the lady shows their lack of 'action' on possible illegal
: operations.

Actually, ARRL staffers have been helpful in sorting out what my options were regarding this lady. It's just that the person at the ARRL info booth wasn't helpful at all. Ed Hare has posted the results of his research on my experience.

: No, I wouldn't try the citizens arrest route. But to call
: the cops, take down a license plate and report it to the
: local authorties/FCC wouldn't be out of line IMHO.

Probably a good suggestion. I suspect that the local police would have had no idea how to proceed in this case. I would imagine that they are not intimately familiar with Part 97 and they probably would have had jurisdictional conflicts.

: But the trully astonishing thread going on here that it is
: 'none of our business' is suprising. I guess thats why all
: the lids, some with 10 years + of haming, are getting away
: with crap like that on 14.300+. Some of us know these
: arses and do nothing....

I agree. What started with my request for information has degenerated into a debate on the legal powers of the average citizen. I stated in my original post that the lady was operating an Alinco DJ-F1T handheld transceiver. This radio was designed as an Amateur band transceiver. It is indeed possible that it was being operated on MARS, CAP, etc. or that the lady had a reciprocal license. It is also quite possible that the radio was being operated in the manner for which it was designed (legally or illegally.)

I am surprised at the number of people who were quick to condemn what they perceived as my quick condemnation of this lady. Look in the mirror, folks. At no time did I suggest that the lady be incarcerated or fined without due process. All that I said was that I suspected that she was operating illegally, and I wanted to know who to take this matter to. I'm sure that the FCC/US Marshalls/police/??? wouldn't have walked up to this lady and handcuffed her on the spot. They probably would have done the same thing

that they do for a motorist stop: Asked to see her license.
Have you ever been pulled over by the police? Did the
officer walk up to your car and tell you that you were under
arrest for driving without a license before he even asked to
see your license? Of course not. Why do NetNews readers
so often assume that anything not explicitly detailed in a
post automatically means that those missing details will be
handled in as outrageous a manner a possible? If I say that
I'm going to try to crack a few DX pileups tonight, do you
assume that I'll be using a 50Kw amplifier to do it? If I
change my mind and say that I'll brush my dog instead, does
that suggest that I'll be using a weed-whacker on him?

: Part 97 is for all of us, and if we don't self-police
: anarchy will rule as it slowly is creeping in on the bands
: now.

Agreed. Now I know what my part is in self-policing the bands.
If any of the 'none of our business' posters want to know, re-read
Ed Hare's post.

: I take pride in the fact that info I fed to the FCC helped
: them confiscate several thousands of dollars of 11 meter
: gear including amps from some local yocals. And I made sure
: they knew who turned them in. Now I can operate on 10 meters
: without their splatter.

Unfortunately, this can lead to less-than-desirable consequences.
People who knowingly break the law ("You mean I *can't* run 2500
watts on CB? Duh...") and get caught/fined/lose-their-neat-goodies
often want to take revenge on those assisted in their capture. The
strange part is that these people often think that they have been
wronged when they are caught. More and more I see an "I want
equality for everybody, but me first..." attitude among my fellow
citizens (and probably myself, too.)

Agreed. I want to fix this stuff ASAP. I can't beleive the previous owner grounded the washing machine to the water pipe as a breaker box is only a couple of feet away!

In article <248lj2$g2p@news1.digex.net>, dale@access.digex.net (Dale Farmer) writes:
|> If at all possible run a new three conductor cable, far, far safer

|> water meter. Some people maintain that this is a good method of corrosion
|> control for the piping. Varies by the local building code.

Fortunately, the water pipes are grounded (at least they are at a similar potential as the neutral according to the polarity tester.) According to the previous owner (who was the original builder) all the pipe is copper except for a few brass fittings.

After my experience in the garage, I'm now thinking I should test all the two-wire outlets for polarity (using a 2-to-3 wire adapter and hooking the green wire from the adapter to a known ground.) I can see the value of doing this for, say, hooking the VCR to the stereo when both are plugged into different outlets.

Another question:

Why is it not important to have a common RF and service entrance ground? Couldn't a ground loop occur in this path? I note that the Collins power supply for the 32S-3 has a three-wire connection, but the Drake AC-4 has a two-wire connection with seperate ground strap (presumably for connection

to an RF ground). Who is right?

567. Cellular mods for R/S Pro-39?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-10 22:44:48 UTC
From: detlef@se01.elk.miles.com
Message-ID: <1993Aug10.224448.16787@se01.elk.miles.com>
Source record: 277998
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc

The shack has the PRO39 scanner on sale this month. I know that some of the earlier 800 MHz scanners could be easily modified (i.e. cut a diode or solder a jumper, etc.) to restore the 823-851 and 868-896 MHz regions. Anybody know if there is a similar mod for this one?

I'll post a summary of replies.

-Mike

>replies:CAMPOS@NTCCLU.NTC.NOKIA.COM

Well, in my case it is taking me over five months after submitting 610
for three times. Mine is still in progress.
My 1st 610 form somehow got processed in three weeks but I got the same old
call again. On the following day, I resubmitted a new 610 and waited
for 14 weeks to find out that the FCC lost my 610.
It has been 4 weeks since I have resubmitted my 3rd 610 to the FCC, and
I am still waiting.....
I hope that the FCC does not lose my 610 again this time..

570. FWD: DSP filters and desired features

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-10 23:45:53 UTC
From: slp9m@cc.usu.edu
Message-ID: <1993Aug10.174553.71017@cc.usu.edu>
Source record: 277996

Dear DXer and Contester Users and Potential Users of DSP filters,

(If someone could post this on any other appropriate reflectors
(other than CQ-CONTEST reflector), I would appreciate it.)

I have had a JPS NIR-10 filter since the product first came out. I have
not yet upgraded to the latest firmware, but feel that its best feature
is the automatic removal of multiple carriers. At Dayton this year I
purchased a Timewave Technology DSP-59. I was very impressed with its
automatic removal of carriers as well as its noise reduction and LP/HP
filter capability, and of its intuitive control operation, especially
the "aggressiveness of the correlation function" adjustment.

I have also been one of the beta sites for the Digital Interactive
DSP-120 filters. Comparing it to the others is a classic apples and
oranges comparison. The DSP-120 has digital record and playback on
the host computer (which it requires for many of its functions and
the other filters do not use a host computer), as well as a graphics
screen display on your computer for filter selection and changing,
and a time domain and frequency domain display. Because of the DSP-120s
wide range of features and computer interface it is somewhat more
difficult to master than the other two which have only knobs and switches
(especially in a contest on Sunday at 4 a.m. local or anytime when the QSO
rate is high). But the DSP-120 lacks the capability of automatic reduction
of multiple carriers that I find quite useful on phone. (In fact my normal
operation involves leaving any DSP engine in the automatic removal mode
for all general operating.) (When the Timewave Technology DSP-59 is switched
to carrier removal mode and it is used on CW, its operation is so fast that
only the leading edges of the dots and dashes get through -- very impressive.)
(The Digital Interactive DSP-120 has an adaptive filter function that when
turned on integrates the spectral components over whatever time you let it
run and designs a matched filter that corresponds to the individual's voice
to which it was listening -- impressive indeed.)

The designer of the DSP-120 is not an amateur radio operator (the filter has
a number of non-ham applications) and relys on feedback from users for adding
and prioritizing new features. I feel that the automatic removal of carriers
is an important feature, maybe even a fundamental feature, and that the lack
of this capability reduces the usefullness (and marketability) of the DSP-120.

So, I am requesting any input from both users of DSP filters as well as
potential users regarding usefullness of various functions on the
currently available filters, as well as a "wish list" for features to
be included in the next generation of DSP filters. Especially interested
in "correlation function" types of filtering, where highly correlated
signals (such as carriers) are rejected, low correlation signals (such

as noise) are rejected, and moderately correlated signals (such as voice) are passed through.

Reply to me directly or via the reflector as appropriate (per Trey's guidelines). I am at broz@csn.org

Thanks for the input! John Brosnahan W0UN

This is kind of last minute planning but, we are looking for amateurs in the following states:Oklahoma, Arkansas, Louisiana, Missouri, Minnesota, Wisconsin and Michigan to participate in a meteor scatter packet experiment. The setup is simple, just monitor the channel and save all received packets to disk. The band used will be 2m. If you would like to participate, e-mail me ASAP. Include a phone number in your reply. Replies to the posting address are OK, but replies to sparker@Coquina.cass.usu.edu or sparker@cedar.hao.ucar.edu are preferred.

1993 2nd Riverina Field day

The Wagga Amateur Radio Club is hosting the 1993 2nd Riverina Field Day at Wagga Wagga on the weekend of August 14th and 15th next.

The event this year will be held at the Murrumbidgee Turf Club facilities with ample cover in case of rain, and carpeted indoor areas.

The event will feature Trade Displays, Fox Hunts, Amateur Television, Packet Radio, and more. Admission charge is 5 dollars per day per adult, 3 dollars concession or 8 dollars for a family. For both days, it is 10 dollars per adult, 3 dollars concession, and 12 dollars per family.

Sounds like a good weekend's entertainment, take your foxhunting gear, and meet old friends at the Riverina Field Day, 14th-15th August.

Information courtesy of Barry VK2KUZ Field Day Co-ordinator

SARTG WW RTTY Contest (21-22 August)

Starts : 3 contest periods: 0000-0800 UTC Saturday, 1600-2400 UTC Saturday, and 0800-1600 UTC Sunday.

Bands: 80, 40, 20, 15 and 10 M.

Classes : a) Single operator, all bands
b) Single operator, single band
c) Multi-operator, single transmitter, all bands
d) SWLs, all bands
Note: Single operator, all bands stations may also enter as
a single band entry of their own choice also.

Modes: RTTY only

Exchange: RST + QSO number, starting with 001.

Multipliers: Each DXCC country on each band, including first
contact with Australia, Canada, Japan and USA. Additionally,
each call area in VK, VE, JA and W will count as one
multiplier on each band.

QSO Points: QSO with own country, 5 points. QSO with other
countries in own continent, 10 points. QSO with other
continents, 15 points. In VK, VE, JA and W, each call area
will count as a separate country.

Scoring: Sum of QSO points x sum of multipliers = total score

Awards: To the top station in each class, country and
district, if the number of QSOs is reasonable.

Logs: Use separate logsheets for each band. Logs must show :
Band, Date/Time (UTC), callsign, exchange message sent and
received, multipliers and QSO points. Summary sheet must show
scoring, class, your callsign, and name and address. Multi-op
stations must show the callsigns and names of all operators
involved. Your comments will be very much appreciated.

IPS weekly report
---
30 July - 5 August 1993
Issue no.: 32
Date of issue: 6 August 1993

Date 30 31 01 02 03 04 05

10cm 98 96 100 101 98 96 94
A 07 07 03 03 07 20 (20 estimated)
T 58 57 52 55 49 64 57

Summary of activity

Solar activity was very low throughout the period.

The geomagnetic field at Learmonth (WA) was quiet to unsettled 30th July, quiet on 31st-3rd, becoming quiet to unsettled with active periods on 4th-5th August.

Ionospheric F2 critical frequencies at Sydney were near predicted monthly values 30th-2nd, and 4th-5th, apart from enhancements of up to 40 per cent 1300-1700 UT on 4th. The F2 frequencies were slightly below predicted vlaues on 3rd August, Spread F at night might have degraded HF communications on 30th.

Forecast for the next week (6 - 12 August)

Solar : Low.

Geomagnetic: Unsettled to active on 7th August, and otherwise quiet to unsettled.

Ionospheric: Near predicted monthly values.

Coming events

August 21st-22nd SARTG WW RTTY Contest.

September 25th-26th CQ/RTTY Journal RTTY Contest

October 16th-17th JARTS WW RTTY Contest

November 13th-14th WAE RTTY Contest

For your information

As there is often QRM on the 40 metre retransmission of the
cast, please note that the transmission will be 3 down from
the advertised frequency.

There is also a possibility of the evening 80 retransmission
moving to a different frequency. We will keep you informed.

To assist Society planning, it would be appreciated if any
stations who utilise this "packet" edition of our Bulletin
would drop a brief note to either the President VK2CTD or the
Broadcast Officer VK2JPA each @VK2RWI. We need to know where
our viewers operate and which facility they use. (For example
we know some who use 40 meters as a back-up to 20, and some who
use "Packet" as a back-up to 20, all such information assists us.
Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065
Australia, for such matters as membership and general
enquiries. Enquiries can also be made by packet to the
President (Col) VK2CTD, or the Secretary (Pat) VK2JPA @VK2RWI

News items may be sent to Broadcast Officer PO Box 60
Blacktown 2148 Australia, or by packet to VK2JPA at VK2RWI.
The Internet address for the Broadcast Officer is :
patl@extro.ucc.su.OZ.AU

The Society welcomes news items on any digital subjects from
anywhere in the broadcast coverage area and we are looking
forward to news from your areas to let other amateurs know
what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer

That concludes ANARTS News Bulletin 771 08/8/93

Inserted by VK2BQS (Jim) Vice-President ANARTS.

573. New 97.113 - repost

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-11 01:24:53 UTC
From: marcbg@feenix.metronet.com
Message-ID: <CBKMLH.868@feenix.metronet.com>
Source record: 278001
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

For those of you who didn't catch it the first time around, here it is again:The following is the 1993 change to FCC rule 97.113

97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(1) Communications specifically prohibited elsewhere in this Part:

(2) Communications for hire or for material compensation, direct or indirect, paid or promised, except as otherwise provided in these rules;

(3) Communications in which the station licensee or control operator has a pecuniary interest, including communications on behalf of an employer. Amateur operators may, however, notify other amateur operators of the availability for sale or trade, of apparatus normally used in an amateur station, provided that such activity is not conducted on a regular basis;

(4) Music using a phone emission except as specifically provided elsewhere in this Section; Communications intended to facilitate a criminal act; Messages in codes or ciphers intended to obscure the meaning thereof, except as otherwise provided herein; Obscene or indecent words or language; or false or deceptive messages, signals, or identification;

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

(b) An amateur station shall not engage in any form of broadcasting, nor may an amateur station transmit one-way communications except as specifically provided in these rules; nor shall an amateur station engage in any activity related to program production or newsgathering for broadcasting purposes, except that communications directly related to the immediate safety of human life or the protection of property may be provided by amateur stations to broadcasters for dissemination to the public where no other means of communication is reasonably available before or at the time of the event.
(c) A control operator may accept compensation as an incident of a teaching position during periods of time when an amateur station is used by that teacher as a part of classroom instruction at an educational institution.
(d) A control operator of a club station may accept compensation for the periods of time when the station is transmitting telegraphy practice or information bulletins, provided that the station transmits such telegraphy practice and bulletins for at least 40 hours per week; schedules operations on at least six amateur service MF and HF bands

using reasonable measures to maximize coverage; where the schedule of normal operating times and frequencies is published at least 30 days in advance of the actual transmissions; and where the control operator does not accept any direct or indirect compensation for any other service as a control operator.
(e) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations,
and communications, including incidental music, originating on United States Government frequencies between a space shuttle and its associated Earth stations. Prior approval for shuttle retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur operators. Propagation, weather forecasts, and shuttle retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.
(f) No amateur station, except an auxiliary, repeater or space station, may automatically retransmit the radio signals of other amateur stations.

: is happening to you and you are assuming it's in AM mode?...

Hmmm. We have an automated weather announcement service at the local airport which transmits AM on 135.075 MHz. I have this in memory 38 on my 530 which was bought in January 1993. It most definitely stores the detector mode in this memory. Using the keystroke sequence to change the mode when this memory is active causes "a3 off" to appear in the display, and the audio almost disappears, although the S-meter still indicates a signal present. Using the same key sequence on "normal" memories with FM signals displays "a3 on" causes the audio to sound a little off but still understandable. All I did to store the AM mode was to set the mode to AM before storing the frequency in memory. I don't remember seeing this specifically mentioned in the manual.

97.5 says that you must have a station license. 97.7 says that there must be a licensed control operator. 97.9 says that an operator license or a copy must be in the possession of the licensee while acting as control operator.

Those sections, at least, don't require that the licensee show the license to anyone on demand. That's in contrast to driving laws, which *do* typically require that you show your license on demand.

Is there another regulation which says that you must show your license to the FCC on demand, even if they can't prove you were transmitting?

I suspect that a lot of amateurs fall into the same category as myself:
I've never sat down and tried to memorize a particular phonetic alphabet,
but after more than 15 years of Amateur Radio(and several years of SWLing
before that), I find that they pretty much just flow, without thinking
about it. I suspect I use some odd combination of the IARU and US
Military alphabets (both of which used to appear in amateur material),
but now that I'm to the point where it's pretty much an unconscious
process, I'm not real sanguine about trying to change it.

Does anyone else besides me find themselves slipping into the use of
phonetics in non-amateur contexts? I caught myself doing it today, when
I called Dell and was giving them the serial id on the back of the
computer.

579. Newbie satellite questions.

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-11 05:05:00 UTC
From: tskloss@zeus.tamu.edu
Message-ID: <11AUG199300053900@zeus.tamu.edu>
Source record: 278007

Howdy, I just passed my tech (no-code, sorry OTs) exams and am now waiting...

In the meantime I would like to to some research on amateur satellite communication. Satellite links interest me the most and I need sources of information. Here at Texas A&M, our library is surpisingly short on amateur radio books (except a few ARRL publications, but no sat stuff).

I have heard that sat links can be done in VHF-UHF and think that a dual-band transciever might work best. If I can decide on what equipment to buy by Christmas, It will most certainly be a happy New Year.

What types of equipment are best for this? Are they data capable? Can they be used for normal VHF/UHF communication via repeaters?

Any help would by greatly appreciated!
Thanks in advance

Anyone know if the later filters made for the 450 / 850 for the
455 IF would fit in the TS 440 ? I have been looking for some
better filter combinations for my 440, and have had no success
looking for used filters out there.

I am also considering the IRCI 2.1 Khz 455 filter, and I have the
Kenwood 1.8 (I have another, anyone ever try to piggyback them
in cascade ? Is it physically do-able? Might be nice to have
16 poles at the 1.8 filter level....and then I have a spare
500 KHz filter for the 440 also, but maybe that is all for
another day.)

Just wondering. Any TS 440 customizers out there? I really like the
basic radio, but want to soup up the selectivity.

|> doing this for, say, hooking the VCR to the stereo when both are plugged
|> into different outlets.

Check carefully! I had one of those cheap little gizmos with the three neon lights that you plug into the outlet, and look for the right combination of lights lighting up. All outlets checked out OK.

Then later, I had two computers hooked up to two different outlets, and I connected a serial cable between them. As I hooked it up to the second computer, I got a ZAPPP! and the circuit breaker went. Also zapped the serial port chips in one computer. What went wrong? Well, one outlet had the hot and neutral reversed, and the ground terminal not connected to a ground wire, but accidentally shorted to the hot wire! Thus all three terminals had the correct voltage RELATIVE TO EACH OTHER, but anything with a three-pin plug that got plugged into that outlet ended up with a hot chassis!

Moral: Don't trust the cheap little gizmos.

Source record: 278012

I have got hold of a 2x 3-500Z amplifier for HF. Although I can tune it up I wonder if I am getting it right. What is the correct proceedure. As there is no screen, it is not like tuning the tetrodes I am used to.

What ought the grid current to be? I know it depends on loading, but there is probably an optimum value at each power output. Assuming 2.5 kV to 3 kV on the anode under load (tapped transformer), what is a reasonable anode current for say 400W PEP output commensurate with good intermod performance and long tube life? What about grid current?

>What about grid current?

The amp should be about 65% efficient if properly tuned. That means you'll see about 225 mils plate current for 400 watts output. Amplifier gain should be on the order of 10-13 db, so grid current should be less than 22 mils with a driver power of about 30-40 watts. Absolute maximum grid current should not be allowed to exceed 50 mils per tube. It's generally best to tune G-G amps for max output at a given drive level using heavy loading, rather than trying to dip and load to a specific plate current, if clean operation is desired.

>Moral: Don't trust the cheap little gizmos.

No, cheap little gizmos like this and the equally useful little
two-wire/neon bulb voltage tester are handy test tools.
The _real_ (TM) Moral is:

Always test your testers - especially when life, limb, or
property is endangered!

To put a ham radio context back into this thread:
I recently noted what seem to be a _severe_ power output drop
on the relative PO meter of my hf rig. This into a wire antenna
I'd carefully tuned with a match/tuner having a built-in VSWR
meter. I grabbed another VSWR meter off my "spares" shelf and
checked the circuit again. I was amazed at how far off the built-in
meter was, and elated to find my power output back up again after
proper tuning.

Side note: this made me leery of the entire tuner, so I shelved
it, and bought a Daiwa automatic antenna tuner at the Atlanta
hamfest. Used, but good condition and a joy to use since it has
a built-in dummy load and two antenna inputs. I _really_ like
the automatic tuning; I'd used a friends TS440T, but this external
tuner seems to have better range and the nice cross-needle meter.

Got a question. Is it legal for a no-coder to work satelites. I've heard both yes and no and need some direction.

As long as you transmit on a frequency that's legal for you (i.e. no 10m uplinks) you're OK. I know of no sattelites that actually work that way anyway. The only thing as a TECHNICIAN you are prohibitted from doing sattelite wise is actually putting them up, as a random user you're the same as anybody else.

97.5 says that you must have a station license. 97.7 says that there must be a licensed control operator. 97.9 says that an operator license or a copy must be in the possession of the licensee while acting as control operator.

Those sections, at least, don't require that the licensee show the license to anyone on demand. That's in contrast to driving laws, which *do* typically require that you show your license on demand.

Is there another regulation which says that you must show your license to the FCC on demand, even if they can't prove you were transmitting?

Dunno about part 97, but on the back of your ticket it says "The station shall be identified by the callsign specified herein and shall be available for inspection upon request by an authorized Commission representative."

Only a (armchair) lawyer could argue that that statement only applies to the station named as the fixed station operation location; common sense tells me the Feds can ask to look at any station operating under your callsign.

>matter to.

I missed the original post, so I don't know what you observed that
lead to your conclusion that she may be operating illegally. I would
hope it was something specific to which one might reasonably make such
a conclusion. If not, and it was simply the fact that she had an HT
then I'd have a problem with having to have her prove to someone else
she had a license. That to me is no different than so called
routine traffic stops to "check credentials." They are both
invasions of privacy in my opinion. I just spent two weeks on
vacation and had an HT on my belt at many times. I'd no more be
inclined to show anyone my license if they can't first make some
specific complaint that I was breaking a specific law(s).

>Agreed. Now I know what my part is in self-policing the bands.
>If any of the 'none of our business' posters want to know, re-read
>Ed Hare's post.

I have no problem with self policing, but I hope it involves establishing
a good case of probable cause before someone takes any action.

Actually, the incident rate or reprisals against people who have lead
to arrests and convictions of people is not very high at all. The TV

and movie industry makes good stories of individual cases, but the
truth is that it rarely happens.

I heard an est. for the peak of 9:15 EST. I dont know where the
info was from but it was reported by the director of the Cleveland
Museum of Natural History's observatory.

If true, this is good news for eastern US veiwing. Better news then
the weather anyway.

>Troposcatter? Is this what happens when little bits of tropo re-enter the
>atmosphere? (:^) Seriously, this is a new term to me. Are troposcatter and
>troposheric ducting related?

I'm not sure what property of the Troposphere causes troposcatter propagation but it is a weak signal mode where you get forward scattering of your signal over the horizon, giving a range of up to about 500 miles on 6m, it is usable on VHF, UHF and SHF. Troposcatter propagation is subject to fast and slow fading.

I used to maintain a tropo link as part of a military phone system. It was a wideband (100+ Khz) FM signal on 2.3 GHz and the two sites were 98 miles apart. With the high power we used and the space and polarity diversity we were able to maintain a 60 dB S/N on our voice circuits with a 99.98% reliability. With amateur requirements (much less S/N needed and narrower bandwidth) the equipment needed should be much less that what we used.

The setup consisted of two 1 Kw transmitters, each going to it's own 2m dish. One was horizontally polarized, the other vertical, for polarity diversity, since fading is less likely to occur in both planes at the same time. On the receive side there were four receivers and a voting system. Two receivers were on the upper dish (about 110'), with one vertical and one horizontal, the other two receivers were on the lower dish (at about 40'), also with one vertical and one horizontally polarized. Giving space diversity and polarity diversity. Our receive signal at the input to the preamps was typically about -90 dBm and normally in the -80 to -100 dBm range, but with ducting it could get up to -20 dBm, or fading could drop it down to -120 dBm. Fast fading had a period of anywhere from 0.5 to 10 seconds with a 10-20 dB variation in the signal, slow fading occurred over hours or days.

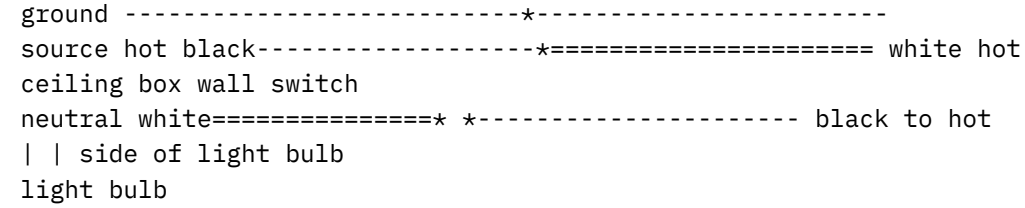
This won't work out in the case where a light bulb in the ceiling is controlled by a remotely wired switch. This is where the power source enters the box that has the light bulb socket, and the controlling switch is in its own box in the wall. Black and white wires come from the source, (packaged in a cable with a third ground wire). As cable only comes with white, black, and ground, to wire the switch, the white wire has to be used for a hot wire.



A book on house wiring I once read mentioned that you're suppose to paint the hot white wire, but they noted that this is "usually not done".

I've heard that they are not allowed to wire this way in Europe. It's done here to make the wiring topography easier.

A few thoughts come to mind...

First, the electrical codes of most locals do not allow "weekend wirerers" to do "weekend wirerering". They generally will allow a homeowner to wire his own house, if he takes a test showing his mastery of the NEC, and then gets the appropriate permit.

Secondly, if you are incapable of mastering, and applying something as simple as the coloring scheme for domestic electrical wiring, you really shouldn't be messing around with the wiring.

Thirdly, if your home burns, and or someone gets hurt, and the relevant authorities determine that unauthorized wiring exists in the area that the fire/accident occurred, you can kiss any help from your insurance company good bye.

And Fourthly, wire costs are way too high already. I'm not so inclined to ask the wire manufacturers to do something that will give them an excuse to raise the prices further.

> c/o Jim Farley
> ABC News
> 125 Westend Ave.
> NY, NY 10023
>
> 73,
> Pete WB0FEW
>
>
>

Well, I finally got the tape and the transcript! Anyway, here is
how to get the tape and transcript of the show on amateur radio.

Send $3.00 for the transcript and/or $7.00 for the cassette tape to:

Perspective
125 West End Avenue
New York, NY 10023

Specify that you want the transcript "Radiating for Fun" by
Hugh Downs recorded on July 1, 1993 and aired on July 11, 1993.
Same for the tape. It is, from reading some other threads, the
radio version of what was supposed to air on 20/20.

73, Pete WB0FEW

PS: If anyone at the ARRL is reading this, you might contact ABC's
legal department about possible use by local clubs for PR.

>ap451@yfn.ysu.edu

Great question. Yes, there is, but it's absurd. Why? Because i costs
almost as much as a new R7! I got an R5 from an estate sale last year, so
the proce was right. I inquuired (with AES) about the price of the
upgrade - I think it's like $269! A new R7 is in the mid-300 range I
think. I can't even imagine why they offer the upgrade at all.

The advice I was given by several hams: If you want the R7, sell your R5
and buy a new R7. It will be the same amount of assembly work and
probably wind up saving you around $100.

What I did: put up a dipole for 80 and 40!

Good luck

You wanted bet your license that if the FCC sees you with a transmitter
on your belt, asks to see your license and you refuse that they wouldn't
suspend your license? I wouldn't...I'm not a lawyer by any means, but
if they can lift your drivers license for refusing a D&A test or to show
your a 'lawfully' licensed driver, the Feds can do the same thing.

Any real lawyers out there? I'd like to hear your opinion

|What i'm talkin about is using the radio without a duplex seting. I want
|to be able to use it simplex sometimes, since it is 50watts. But
|the radio, and instruction book have not shown me any way of setting
|it like this. The only way i found i can create a simplex setup is
|if i press the Func key, chose "shift" (offset) and set it to 00..

It's easier than that. I don't remember the exact sequence, you'll
have to experiment (the radio is in the xyl's vehicle), but hit
function then shift; then hit function and shift again (or maybe just
shift?) and it will choose another option - repeat this to cycle
through the usual plus / minus / none settings. And of course you can
store a simplex frequency in a memory or in the "call" frequency.

Again, you'll have to experiment; but it is possible.

>Richardson, TX 75085 | |

Actually it is 199.95 from AES. You should be able to get $175 or so for
an R5 (that's what I got for mine) and then the R7 is $379.95 making the
upgrade about $205. In either case it's going to cost you about 2 bills.

Might as well get ALL new hardware instead of half old and half new up
there for the same price.

I have had good luck with my R5 then R7 after getting the tuning set. It
really comes very close to the data sheet specs.

Hmm, 2225 UTC would seem to be 1825 EDT, not 9:15 pm EST. Assuming the sky clears tonight on the East coast of the US does that mean it is not worth going out? i.e. I assume from the net traffic that no one is going out on a limb at specific predictions, but I thought that the geometry favored early morning viewing.

Many of us would be interested in any reports from Europe tonight and would plan to check in on the net. Please post even if a late hour in the U. S.

614. HELP -- Squelch on Maxon 49-EA radio...

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-11 19:54:01 UTC
From: mas@porgy.jpl.nasa.gov
Message-ID: <MAS.93Aug11125401@porgy.jpl.nasa.gov>
Source record: 277938
Cross-posted to: alt.stagecraft,rec.radio.amateur.misc

Does anyone know how to set the squelch on one of these radios???

My community theatre group uses the above mentioned FM radios for communication among the stage crew. A couple of them (not all) seem to have the squelch perpetually open (ie: there's constant white noise when no one is transmitting). There is no squelch control on the outside. I opened one up and found about six potentiometers on the inside, none of which were labelled "squelch." I called the people at Maxon, but they won't tell me anything. Their best suggestion was that I send it in for repairs.

Can anyone help??

Please email me if you can...

advTHANKSance,
Marc

>

As long as the frequency you need to transmit on to use the satellite is within your privs (all of 'em with the exception of the HF inputs of RS10/11 and RS12/13 will be), then it's perfectly legal. The fact that the satellite decides to retransmit your signal elsewhere is of no concern to you. You are not 'controlling' the satellite - you're using it. Just like a crossband repeater is legal for you to use, so are the sats. As for listening to the sat downlink if it's outside you privs that still legal - ECPA and commie liberals notwithstanding. Have fun!!! Remember - you're an honest to god Technician class licensee who's binary communicatorially challenged :-)

Hi all,

I just picked up a Navy surplus AN/URR-27A receiver, which seems to have a coverage range of about 103-200 MHz. Of couse I didn't get any docs, and there are a few key items that I need to know before I can even give it juice.

1) There is no power cord. The unit is rated for 105/115/120 V, single phase, 50-60 Hz. The power connector is a screw-cap type, with 4 pins protruding inside. Which pin is what? Is the cap safety ground?

2) There is an unmarked 1/4" phone jack on the front beside the power switch. I assume that this is for phones. Correct?

3) There is another screw-cap type connector on the rear marked "audio", with 3 pins protruding. Which pin is what? Is this power-level audio, i.e., speaker, or does it require amplification?

4) The person that I got this from thinks that it is FM. Is this true?

Of course, if anybody has some docs for this, or knows where I can get them, they would be greatly appreciated. My US mail address is 11 Maple Row, Bethel, CT 06801.

: It can be confusing since for AC BLACK is hot and WHITE is neutral/ground
: but for DC BLACK is negative (ground) and RED is positive (HOT).

I'm really kind of suprised that no one has noticed that up until about 30
years ago a lot of automobiles were _positive_ ground rather than the now-
standard negative ground. Thus, the negative wire was "hot". Also, note
that by far the biggest use of DC before the invention of the transistor
(at least, low voltage DC) was in automobiles. So for positive ground
DC systems, the color code matches AC.

I will be in the Midland, MI area during the next week and would like to know the *most used* repeaters in the area on 10m, 2m, and 70cm bands, and if there are any regular on-air swapnets held during the week. The Midland County fair will also be held that week, so if there is any local ARC activity or tents there, those frequencies would be appreciated too. Any and all replies sent before 4PM PST on 8/13 would be appreciated since my plane leaves that night. :-)

Thanks, in advance

624. Code learning questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 00:52:14 UTC
From: bruce@mongo.Com
Message-ID: <1993Aug12.005214.20557@pixar.com>
Source record: 277956

I'm trying to get to 20 WPM code for the extra class license. I've passed the theory tests through advanced, and extra theory won't be a problem.

I can recognize individual characters at 35 WPM without trouble, but can't keep up with word rates much beyond 13 WPM.
I practice for about an hour each day. First I download the Associated Press news summary from Compuserve, and have Morse Academy send that while I copy in my head, using 13 WPM word rate and 22 WPM characters. Then I have Morse Academy send random code groups that I type back to it on the keyboard. I'm currently using three-character code groups at 22 WPM word rate and 22 WPM character rate, and will use longer groups once I copy better. I used 5-9 character groups at lower speeds. I have Jerry Ziliak's "Code Words" tape, which I've used to learn to recognize simple words like TX RX WX HW CPY OM QSL and so on at high speed. I have a few questions:

1. Am I doing something really wrong? Progress comes very slowly. It's getting rather frustrating.

2. I see claims about people copying at astounding rates, some claim 75 WPM. Can these people copy random character groups at this speed?

3. Do most hams who copy at 20 WPM only recognize "the usual QSO words" at that rate? I suppose it's enough to pass the test, but I'd hate to be able to say nothing more than WX HERE IS HOT RIG IS FT-301D ANT IS ISOLOOP TNX FER NICE QSO OM 73.

4. Is there a "Farnsworth" variation where it is the word space that is lengthened rather than the character space? I would think that this would aid training in word recognition. Is there any PC software that implements this?

Thanks

626. electrical grounding...

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 03:23:06 UTC
From: dale@access.digex.net
Message-ID: <24cd2q$9jd@news1.digex.net>
Source record: 277950

To start a newish thread...
In one of the emergency power off discussions somebody asked why their radio ground is not tied to the building electrical ground.

When you have multiple grounds that are independently tied to earth you are running a non trivial safety hazard, and can introduce a lot of interference to your gear from ground loops. Because the earth has different resistances at different places, all of these grounding points will be at slightly different voltages, sometimes not so slight. A ground loop is where one piece of gear is grounded to say the electrical service ground, (like the transmitter) and another piece of gear is tied to a shack ground. (like say a tuner or something) The voltage difference tries to equalize thru the path of least resistance, which is also the signal path, poof ugly noise in your audio.

I simplified things a lot but I don't feel like typing for the next three hours.

What you should do, (and if you live in the US, is probably the law) is to create somewhere in your house or whatever, is a grounding bus. This is a heavy gauge (usually) copper block with a bunch of screw terminals for attaching heavy gauge wire to. This is tied to the electrical service entrance ground, the water pipe, the ground stakes, the foundation, the building steel, everything. Then from the ground bus you run a nice heavy solid copper isolated ground to your shack. Everything in your shack that does not get a ground from the power outlet gets tied to that ground wire. This gives you a form of isolated ground. To have your electrical outlets qualify as isolated ground outlets the ground wire has to run all the way back to the service entrance ground bus, running in the same cable or conduit as the current carrying conductors. Having an extension of the building ground bus in the shack and all the shack power coming from isolated ground outlets will virtually eliminate ground loops and give you a very electrically safe shack.

The caveat is about lightning rods and lightning arrestors. those should be tied to their own separate grounding system, and tied at only one point to the building ground bus.

The ease of this system is if the grounding is not good enough, you just go out and plant a few more stakes and tie them directly to the grounding bus. I advise you to stick the bus down in the basement somewhere, If you are unlucky enough to pick up a direct or nearby lightning strike the grounding bus will have plenty nuff zoobs in it to kill you. If you are going to actually do this check the NEC or your local electrical code if different, and the section on grounding in the ARRL book. read carefully and several times.

Source record: 277955

lodonoho@vax1.tcd.ie writes:

>Does anyone out there have a basic spec. for RTTY?

The old standard specified a shift of 850 Hz on every band. In
contrast to the commercial services, the ham service uses
mark frequency > space frequency. The news standard used today
changes the shift to 170 Hz for every band < 30 MHz.

When using AFSK:

The old standard was Mark = 2975 Hz and Space = 2125 Hz.
The new standard is Mark = 2125 Hz and Space = 1275 Hz in the case
of 850 Hz shift, Mark = 1445 Hz and Space = 1275 Hz in the case
of 170 Hz shift. The new standard is called IARU Warsow standard.

I suppose most of the high speed operators can keep up with a 20 wpm
free format discussion, but don't bother with details when operating
contests or other fixed format exchanges.

4. Is there a "Farnsworth" variation where it is the word space that is
lengthened rather than the character space? I would think that this would
aid training in word recognition. Is there any PC software that implements
this?

Haven't heard of it.

Thanks
Bruce Perens KD6OTD

Advice: Don't get worried Bruce. You're doing fine. It's normal to hit
a wall at about that speed. It's at the point where you have to begin
head copying. If you keep at it you'll overcome it. However.... I suggest
that you just go and take the test. Use the "Wheel of Fortune" (R)
technique. As the test tape rolls, just copy every letter you can and
leave dashes for those you can't. When the test is over you have as much
time as you need to fill in the blanks. If you can copy 13 wpm that's about
two thirds of the required 20 wpm. You ought to be able to make out the

information with only two of every three letters present. The call signs in the "simulated qso" are given twice, once at the beginning and again at the end so you get two cracks at them. There will be at least one slash, comma, period and each prosign. That's it. Then answer the question sheet.

Example: The question is "WHAT IS THE SENDERS LOCATION?" but all you managed to copy is "QT- E- CH-CAG-- I-." (I don't know about you but that sure looks like "QTH ES CHICAGO, IL." to me.... Note the comma.... It's there even if you can't copy it.....)

Some folks may criticise you for even wanting to use Morse code at all. That's okay. It makes them feel good to make others feel bad. They must live a pretty dismal life. Don't let them discourage you.

Myself, I use Morse code almost exclusively when I'm on HF. I like it. I'm not very fast. I can do 13 wpm with little trouble and 18 with a few blank spaces. I can handle "cookie cutter" exchanges at up to 20. So what does that prove? .... Nothing. It doesn't make me any better than anyone else. Hopefully, no worse either.

For what it's worth.... I hold an Extra class license, I'm a VE, I'm on the board of directors in our radio club and editor of the newsletter. Oh, and by the way.... I think that the high speed Morse code requirement is irrelevant given todays technology. I would much rather see it replaced with an equally difficult challenge that is based upon more contempory communications technology. But unless and until it is ... it's the way things work.

Drop me a line when (not "if") you pass 1C.

633. training programs for amateur radio operators in emerg svc

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 14:59:01 UTC
From: bihler@sequent.com
Message-ID: <1993Aug12.145901.16483@sequent.com>
Source record: 277961
Cross-posted to: misc.emerg-services,rec.radio.amateur.misc

I'm about to try and develop a training program for amateur radio operators involved with emergency services in our area. I have several ideas but would like to solicate ideas and comments about what others have done in this area. So... if you've been involved in training amateurs for ARES, RACES or any other emergency program, I'd really appreciate any information you might have to offer such as class syllabus', available inter-agency programs, etc.

If there's enough interest, I'd be glad to post a summary.

tia.

634. Authors needed for ARRL Handbook

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 15:08:50 UTC
From: rschetge%arrl.org
Message-ID: <2031@arrl.org>
Source record: 277964

Hello! I am the editor of the ARRL Handbook [flameproof
suit on 8^)], and I need authors for several chapters of the
1995 edition.
Not all of each chapter will be newly written text. I
want authors to:

1) Determine the essential material to cover.
2) Review what's in the existing Handbook (use
the '93 index, as a guide).
3) Provide a detailed chapter outline ASAP.
The chapter should include whatever is in the
general outline, but content and presentation
are open to discussion at this point.
4) Write additional material as needed, edit
existing material to meet our present goals
(practical, clear, concise) and blend the
written and edited material into a coherent
chapter.

Authors are listed in the front of the book as
Contributors in the edition where their material first appears.
Once your detailed outline is approved, we will issue a contract for
the work. (Deadlines are open to negotiation for now.)
Contributors are compensated for their work at the standard
ARRL rate of $65 per printed page.

Please contact me if you are interested. (I will be out
of town from 15-22 Aug. During that time you can contact
Joel Kleinman, N1BKE, email: jkleinma@arrl.org, or the
chapter Handling Editors for more information.)

Here are some quick descriptions with page
counts and deadlines, followed by general outlines. Pay
particular attention to the chapter goals.

Amplifiers & Projects (general discussion)
Printed Pages: 60 Manuscript: 180 - 240 pp*
Draft to HQ: MS to HQ:

Chapter General Outlines follow:

Amplifiers & Projects

Goal: Discuss amplifier concepts as a general case: drive, gain, frequency response, feedback, noise, distortion, dissipated power and cooling. Continue with differences between amplifiers performing various functions: AF/RF, low level vs high level, linear vs nonlinear. Provide the reader with information to design and apply amplifiers appropriate to common Amateur Radio applications. Present amplifier projects from transistor switches through preamps to legal-limit PAs.

Content:

Introduction

Separate design techniques evolved tor different areas of the spectrum because HF tubes did not function well at VHF, or VHF tubes at UHF. Since HF semicons function reasonably well at VHF, and VHF/UHF transistors may be applied at HF, there should be equal care exercized at all application frequencies. Also, the changing properties of other circuit elements apply to a greater or lesser degree at all frequencies. Therefore, the HF, VHF, UHF labels have been dropped from our general discussion of

amplifiers, although they remain on specific projects.
What is amplification?

[Projects

[HF

[50W linear transistor PA (3W in, new) Gary Breed has project candidate. See Breed's (K9AY) letter for more info on this.
Solid state up to 150 W
(1)3-500Z (include 4-400 broadcast-pulls info with warnings - re triode connected, see Comments)
[(2)3-500Z (in 1993)
[legal-limit (de college student or Jack Morgan, W1FEA, see MW)

[VHF/UHF

[Dual-gate MOSFET preamp for 6m (w/ parts for 10m)
[Dual-gate GaAsFET preamps for VHF and UHF
[Homebrew VHF/UHF bricks for 6m-440 at 10W and 100W levels. Give Mascaro's QST hybrid-module bricks (or updates) as alternatives. Show performance/cost tradeoffs of discrete vs modules.

Comments:

1.Under "(1) 3-500Z (include 4-400 broadcast-pulls info), 4-400's Amp 4-1000's operated as triodes are not very linear - would prefer you stick with 3-500Z which are excellent. 4-400's and 4-1000's as triodes fine for CW, RTTY, FM. - Telewski, WA7TZY
2.I should be able to participate in this section, provided you clearly bound the extents of the discussion so that authors do not get carried away with their thermal discussions. - Jansson, WD4FAB
3.A little three-transistor audio amplifier in Solid State Design used DC feedback for stabilizing the bias but was open-loop at AF. It would make a good example circuit for several topics. For additional projects I'd look in Solid State Design. You should at least include op-amp and LM386 audio amplifiers. - From: Roy Lewallen, W7EL
4.I would like to see more construction info. on high-power Class B linear amplifiers. The importance and design of the tuned input-circuits should be stressed. Also, how about using toroids instead of rods for the filament chokes and powerdered iron-core coils for the extra inductance needed for the 160-meter band? Information of RF plate chokes could also be improved. - Sevick, W2FMI
5. Discuss briefly Class D and Class E high efficiency

switching-mode RF power amplifiers (I could supply a
two-paragraph brief text if you wish). - Nathan Sokal I can
supply reference citations to list in this chapter for Class D
and E RF power amplifiers, if you wish.

==========

Mixers

Goal: Discuss mixing theories, mixing products, balance, drive
levels, terminations and their effects. Provide the reader with
a working knowledge of modulators and demodulators for all
modes. Present the reader with the pros and cons of various
mixers, modulators and demodulators. Include sufficient
information to apply simple versions in home projects. Point to
DSP chapter for advanced information.

>
>How would they know which license to suspend?

The FCC has statutory authority to inspect any station for any reason
at any reasonable hour. (They aren't supposed to come knocking on
your door at 3 am unless they have evidence you're operating. Evidence
of operation is prima facia evidence that it's a reasonable hour.) A
station inspection includes the equipment and all relevant documents,
including your license(s). Refusing to allow an inspection is itself a
violation of the rules and can subject you to fines and revocation
of your license(s). When walking with a HT, you *are* the station, it
can be assumed it's a reasonable hour, and they can demand to inspect
your equipment and your license documents. Since our station and
operator licenses are printed on the same piece of paper, it would
be difficult for them not to see if you had the proper operator
priviledges for the station you are carrying. Failure to have the
station license documents present at the station location is also
a violation.

So the short answer is that they could suspend *any* and *all*
licenses you may hold if they find you without the proper documents,
or if you refuse inspection.

>If it's there only for prestige, the I DON'T NEED EXTRA !
>I can do all I want with my Advanced class license.

We keep coming back to the "CW or not CW" question. There are compelling arguments for keeping the CW requirements, and there are some very good arguments for splitting the CW and phone and digital stuff into three separate endorsement tracks:

Basic HF license = 5 wpm, simple "phone" theory, simple "digital" theory

CW endorsements: 13 wpm gets most of CW bands, 20 wpm gets lower 25 kHz

Digital endorsements: AMTOR, RTTY, PACKET, SSTV, etc., etc.

Phone endorsements: First level gives General phone bands, 2nd level gives the rest.

So you run into someone with:

Basic license plus 13 wpm, level 2 phone, Packet, and RTTY.

Can you imagine the bookkeeping? It makes sense, but the complexity...

And what's wrong with incentive licensing? So you want something (like the lower edges of the phone and CW bands) for nothing? It doesn't work that way, I'm afraid. If it did, we would all be doctors, lawyers, professional athletes, or members of other high-paying professions, and we'd all have a BREEZE getting through college. Basically, if you want something good (like the lower 25 kHz of the sub-bands), you have to do something (like Extra theory and - arbitrarily) 20 wpm code.

So in a way, it is kind of a PRESTIGE THING. And what's wrong with that? So is being a pro basketball player and making $2.5 mil/yr.

Does anyone know how 170 Hz. was arrived at? You certainly
don't need that much shift for 60 WPM RTTY or even 100 WPM.
Why wasn't an even narrower shift chosen? I always wondered
about this.

Well, lessee... I've licensed three hundred and six nine year olds,
all from one 4th grade classroom on Cape Cod. All as Novices, so
obviously they all successfully took the Morse Code element.

What's unusual, perhaps, is that not one ever failed the Morse
element. Wait, I take that back; one severely learning-disabled
fellow did fail, at which point I turned right around and gave
him another CW exam which he passed.

There's something to be said for peer pressure; he was REALLY under
the gun, as his 28 classmates had just finished breezing through it.

Thought you might appreciate that as a success story.

Interested in the Amateur Radio Service, but don't
know where to turn to locally for assistance?

Well, one of the very best ways to get a local helping
hand is to establish a relationship with your local
Amateur Radio club. And most areas of the country have
more clubs than you'd think possible.

Ah, but the eternal question is always "Say, just how
DO I contact an Amateur Radio club near me?"

Well, folks, do I have a deal for you!

For the price of a message to me here at ARRL HQ,
(SEEMS cheap enough!) and a specific request, I can get
you listings of more clubs than you'd ever want to visit.

To make it happen, please send me a message with your
name, your mailing address, and a specific request for the
Amateur Radio clubs in your area. I'll get them right out
to you.

And for those of you who are already licensed radio
amateurs, remember, your local clubs represent an ENORMOUS
resource for you.

Having trouble with TVI or local ordinances that
affect your capability to serve the public by way of your
Amateur Radio license? Interested in finding someone to
assist with a tower installation? Need to locate a
kindred spirit that understands YOUR concerns about
Amateur Radio satellite operation or digital networking
via Amateur Radio? Chances are that someone in your club
can help.

Another free service, brought to you by the world's
largest support organization for the Amateur Radio Service
-- the American Radio Relay League.

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
-
2. Listings of Amateur Radio clubs in his location.
-
3. Helpful promotional material about the Amateur Radio
Service.
-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
-

To obtain any of these free ARRL services, please
provide me with:
-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services
above.
-

>satellites in orbit currently have VHF and higher uplinks and Technicians
>as well as Technicians+ can operate them.
>

Actually, RS-12 is the Mode K satellite. It's been locked in this
mode for some time.

It is the only satellite that Technicians (Plus and otherwise) cannot
use. However, the RS-12 CW "Robot" listens for signals at 21.129--right
in the middle of the 15-meter Novice/Technician CW subband. The satellite
responds with a "QSO number" which you can use to get a QSL card.
Kind of a neat way for Novices to get a small taste of satellite
communications!

THE WVARA HOMECOMING HAMFEST
(FORMERLY THE WABASH VALLEY HAMFEST)
Sponsored by The Wabash Valley Amateur Radio Association, Inc.

SATURDAY, OCTOBER 2, 1993
7 AM to 4 PM
Clay County 4-H Fairgrounds
2-1/2 Miles North of I-70 on Ind 59 in Brazil, Indiana
(Rain or Shine) This is an INDOOR hamfest in a spacious facility.

Tickets are $5. Advance ticket sales are in effect until August 15,1993.

There will be a special drawing for holders of advance sale tickets.
The prize will be FIFTY DOLLARS. For advance sale tickets send check to:
Tickets
WVARA Hamfest
P.O. Box 81
Terre haute, IN 47808

CASH DOOR PRIZE! HOURLY PRIZES
FREE BINGO 2-M TRANSMITTER HUNTS
INDOOR FLEA MARKET BREAKFAST SERVED 7-10 AM
VE TESTING SESSION 10 AM LUNCH SERVED 11 - 2 PM

TALK IN: CALL W9UUU, 146.85 OR 444.35

VENDORS: Forty tables are available at $5 each. Some tables will have
120-V a-c power. Specify if you want electricity. Spots with electricity
will be available on a first come, first served basis at no extra charge.
All vendors must purchase a ticket.

For table space send your reservation stating the number of tables you
want
and a check for $5 for each table to:

>ARRL book. read carefully and several times.

Let me expand on this a bit with an example. Suppose you have a station feeding a grounded vertical antenna (or really any antenna and RF ground system) via coax. The system looks something like this:

```
lightning
/
AC panel----station---coax--antenna
| |
Power Gnd---Gnd resistance---RF Gnd
```

Now you have two paths for ground current, through your station via the coax shield and power wiring safety wire (green) to the power ground, and through the RF ground. Assuming neither ground connection is perfect, and they won't be because the lightning current causes saturation effects in soil, the current is going to divide into two paths. One directly into the soil via the RF ground, and the other through your equipment to the power ground connection and hence into an unstaturated part of the soil. This is not good.

There are two approaches you can take to fix this problem. The first is to improve the connection between RF ground and power ground by running a heavy copper conductor directly between the two. Like this:

```
lightning
/
AC panel----station---coax--antenna
| |
|--------copper bond--------|
Power Gnd---Gnd resistance---RF Gnd
```

This shunts the ground resistance between them. That still leaves you with two paths for lightning current to flow, through the bond wire, and through station wiring. But now station wiring isn't the obviously superior path and less current will flow through the station equipment. This still isn't very good since lightning currents can be very large and even a small fraction of that current can still cause equipment damage.

The second approach is a little more subtle. It's called the ground window approach and looks like this:

```
Lightning
/
station=======X--coax---Ant
| |
power panel-----------------| |
| |
| |
power Gnd-----earth resistance-------RF Gnd
```

The X is the ground window where the coax shield and the power safety wire are bonded together, and where hot power leads and coax centers are attached to suppressors which are connected to the same single point. Now there are no loops through the station equipment except for low level voltages below the suppressor thresholds. Now when

lightning strikes, there are still two paths for the current, through the RF ground, and through the coax to the ground window and through the safety wire to power panel ground. Neither goes through your equipment. This is much better.

You can now combine the two approaches and get the following configuration:

```
Lightning
/
station=======X--coax---Ant
|\ |
power panel-----------------| \ |
| \-bond-|
|-------copper bond----------------|
power Gnd-----earth resistance-------RF Gnd
```

This gives the best protection. Note that the station now floats at the potential of X. Since X is grounded, that's fine for ordinary electrical safety. This point's potential can rise during a strike, but there's no path for current through the station since all wires connected to the station must first pass through X and have their potentials equalized. Current can't flow between two points of equal potential.

Some further notes on the ground window. *Every* wire that enters or leaves the station must pass through the ground window and be bonded either directly or through suppressors to the common point ground. There should be no daisy chain grounds between the pieces of station equipment. Each piece should ground separately to the common point. To prevent RF current loops in the station, the common point should be physically close to the station equipment.

Note that you *can* bond all the equipment directly together if you do it right, in essence making one big box, such as by rack mounting. The key is to get a low resistance *and* low inductance connection capable of handling very high surge currents. A number 10 wire looped box to box on a wooden desk is unlikely to suffice.

And most important, all leads from the common point to ground should be as low inductance as possible. The major source of voltage rise during a lightning strike is voltage developed across the inductance of the ground path wiring, not it's, usually very low, resistance. Note also that the ground window, and your station equipment can rise in potential during a strike. This can present a safety hazard to personnel, but *no more so* than with other ordinary wiring practices. The key point to remember here is that, during lightning strikes, ground points are not zero potential and contacting *any* electrical equipment may be hazardous to your health. *Back off* until the storm subsides.

There's a sticky problem that can arise with interconnections between different boxes of station equipment. For example, the coax connecting

a transceiver to an amplifier or tuner will form a daisy chain connection between the boxes. That won't normally cause problems with respect to lightning as long as the boxes are all connected to the common point, but it can cause RF loops that can upset operations. That's especially true at VHF and above where the connections become an appreciable fraction of a wavelength. The approach to solving that problem is the same. Route these interconnect cables through the ground window as well and ground their shields to it. That shorts the loops. That won't always work, however, since you may get mutual inductive coupling between the wires running from the common point back to station equipment. Experimentation with wire lengths and placement is the only cure in this case. (Ferrite chokes slipped over the coax can help too in some stubborn cases of RF loops.)

Your station *can* survive direct lightning hits, broadcast stations do it during every storm, but attention to detail is *critical* to making that happen. One stray connection that fails to follow the rules can trash an otherwise perfectly protected installation. Lightning is no different than other electrical phenomina, it has no mysterious mind of it's own. It has to follow the same electical laws as a flashlight. If you understand Kirchoff's laws, Ohm's law, and how to calculate inductive and capacitive reactance for a stepped waveform, you can understand how lightning voltages and currents behave with respect to station equipment and wiring.

This will get the attention of the OM's out there! Does anyone know where I can get some "dial cord". Probably at the same place that sells "Relative Bearing Grease!". The radio in my 1960 VW bug uses dial cord, and it has broken. Any help would be appreciated!

646. Re: 900 meg bandplan???

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 17:44:22 UTC
From: edmitch@microsoft.com
Message-ID: <1993Aug12.174422.15238@microsoft.com>
Source record: 277872

There are a wide variety of Part 15 devices operating in the 902-928 MHz band. NCR's WaveLAN operates a direct sequence spread spectrum data LAN here. Telxon's handheld retail terminals also operate DS SS here. This fall, a variety of cordless telephones using digital SS will operate in this band. These consumer level phones were shown at the Consumer Electronics Show earlier this year. I believe most will have a power level around 1/4w to 1/2w (battery life is a key issue for them). I know that some have claimed that in the clear, your handheld SS 902 MHz cordless phone will operate over distances measured in miles.

Teletrac and other vehicle location systems will roll out nationwide as a primary user of this band. Most hams have not appreciated that all of our UHF allocations are "junk" bands. To some extent this is a blessing - we would have a hard time justifying our access (hey, I believe we deserve them but its hard to convince others sometimes) to some of these bands if it were not that their "poor quality" renders them less than suitable for Landmobile and other functions. If you've listened to PAVE/PAWS radar on 430-450 MHz, microwave ovens on 2.4 GHz, or soon to come, doppler wind shear radar on 448-450 MHz everywhere, you'll know what I mean about "junk bands". Paying customers couldn't justify the noise we put up with so they leave us alone so far. But the advent of digital spread spectrum enables new devices to live with more noise than before - and consequently, you will see greatly increased use of 902-928 and 2400-2483 MHz Part 15 operations Real Soon Now. Fortunately, Part 15 devices are third class citizens and I suspect they will stay that way. Ham interference to them is probably going to be less of a problem than Part 15 to Part 15 interference, microwave oven interference, and other high power users like Teletrac. That's good news for keeping at least some limited access to these bands. I know, its hard to see how any of this is good news, but I'm trying to look at the bright side.

Only if the call has been issued can they tell what the callsign will be. My wife was licensed several years ago. And since we were moving in a few months we were concerned about receiving the license prior to the move. So around 8+ weeks, I called the FCC licensing office and they were able to tell us that the license was issued and mailing out that day. They did also give out the callsign at that time with a reminder that the callsign could not be used until the license was received.

648. RSGB GB2RS NEWS 15TH AUGUST

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 17:49:48 UTC
From: ted@tedb.demon.co.uk
Message-ID: <745177788snz@tedb.demon.co.uk>
Source record: 277843
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur,rec.radio.info

Good morning. It's Sunday the 15th of August and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- It's easier to operate in Romania; the RSGB Datacomms Committee needs some new members and the south coast microwave beacon is off the air.

The Radiocommunications Agency has announced that the Romanian Inspectorate of Radio Communications has implemented the CEPT Recommendation TR61-01. This means that UK amateurs may operate in Romania without obtaining a reciprocal licence. CEPT 1st Class and 2nd Class Licences are valid. Foreign amateurs visiting Romania should prefix their callsigns with YO. The contact address is General Inspectorate of Communications, 202A Splauil Indepentei, Bucharest, 77208 Romania. Fax: 40 1 3124797. Romanian amateurs may now, of course, operate in the UK using the G0/ or G7/ prefix depending on the type of licence held.

The new RSGB Intruder Watch Coordinator is Chris Cummings, G4BOH, whose address is correct in the current RSGB Call Book. He takes over from David Owen, G0OES. The Intruder Watch, part of the IARU Monitoring Service, has the job of detecting and identifying commercial intruders into exclusive amateur bands, and ultimately having them removed. This is a service provided for all radio amateurs by the Radio Society of Great Britain.

The south coast microwave beacon GB3ESB, on 1296.970MHz was taken out of service last Saturday the 14th, following the loss of permission to use the site. The Hastings Repeater Group has a new site in mind and GB2RS will keep you informed of developments. The Beacon Keeper is Mick, G4PRJ who address is correct in the RSGB Call Book.

Attention data communication experts: Several vacancies now exist for volunteers to serve on the RSGB's Data Communications Committee. A Minutes Secretary is required plus others with expertise in the field of TCP/IP and the DX Cluster. If you are interested, please write in the first instance to the new chairman of the Data Comms Committee, Tom Lilley, G1YAA, whose address is correct in the RSGB Call Book.

RSGB Members in Zone C - the South-East of England - will be interested to know that Zone Council Member Neil Lasher, G6HIU, has changed his address. His new address is 8 Highwood Grove, Mill Hill, London NW7 3LY.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Malawi, IN3VZE will sign 7Q7CE from today Sunday the 15th until Friday the 10th of September. From St Maarten, F2YT and F1MVT will sign PJ7/own-call from today Sunday the 15th to Monday the

30th of August. Operation will be on all bands, but giving special attention to the WARC bands. From Kampuchea, VS6WV will sign XU6WV from Saturday the 21st until Wednesday the 25th of August on 40, 30 and 20 metres, mainly from 1030 - 1200GMT daily. And from Mongolia, JT1CS and JT1/KB9IBZ will be active from the JT3 call area from Thursday the 26th for one week. Activity will be on all bands 6 - 80 metres on CW, SSB and RTTY.

We know of only one rally taking place today Sunday the 15th:

The Southend and District Radio Society Rally is being held at the Rocheway Centre, Rochford, near Southend on Sea, Essex. Doors open at 10.00am. The event features a bring & buy stall and a car boot sale. Refreshments will be available.

We have been notified of only one rally for Sunday the 22nd of August:

This is the West Manchester Radio Club Summer Rally - the "Red Rose Rally" - which is to be held at the Bolton Sports and Exhibition Centre, Silverwell Street, Bolton. Located in the town centre. Doors open at 11.00am, or 10.30 for disabled visitors. There will be all the usual trade stands, society stands and a bring and buy stall, all of which are situated at pavement level. Refreshments and meals will be available all day. Details from Dave, G1IOO on 0204 24104, evenings only.

Next a reminder that the venue for the Torbay Mobile Rally, scheduled for Sunday the 29th of August, has been changed from that originally advertised. The new venue is the Audley Park School, Barton Road, Torquay. Further details from G3HTX on 0803 526762.

HF contest news now:

There is still time to take part in the Worked All Europe DX CW Contest taking place this weekend, which started yesterday at 1200 noon and finishes today Sunday the 15th at 2400. See August RadCom page 16 for details. The next scheduled RSGB HF event is the SSB Field Day Contest held over the weekend Saturday the 4th and Sunday the 5th of September. See July RadCom page 81 for details.

VHF contest news:

The RSGB's 2nd 432MHz Fixed Contest will take place next Sunday the 22nd of August from 1600 - 2000GMT. There are three sections, Single Operator fixed, Others fixed and SWL. See February RadCom page 67 for further details.

Special event stations this week include:

GB4ASH, operated today, Sunday the 15th, from the Ashfield Show, Sutton Lawn, Sutton in Ashfield. The station is run by Mansfield Amateur Radio Society club members. Any one interested in amateur radio is very welcome to visit at the site. The Amateur Radio Club of Fakenham will air the call sign GB2FSW during their annual event at the Fakenham Splash Week from tomorrow, Monday the 16th to Friday the 20th of August. The venue is the Fakenham High School, Wells Road site. For further information contact Dave, G4DCJ, telephone: 0485 528633.

And now the solar factual data

With the quieter side of the sun coming into view during the period from the 2nd to the 8th of August, solar activity declined. However, but due to the passage of coronal holes magnetic activity reached sub storm levels, resulting in a decline in HF band conditions. There have not been any flares of note reported this week. The sunspot count meaned at only about 60 giving an indication of how rapidly the cycle is declining. The solar flux levels are also continuing to decline and averaged 95 units for the period. So far this year the mean levels have declined from about the 140s down to the present levels of around 95. There is also a reduction in the difference between the highs and lows with the sun's rotation. Last January the difference was 50 units but it is now only about 20. The geomagnetic Ap indices were quiet up to the 3rd, but then rose to substorm levels of 27 units on the 4th, with very unsettled levels from then on. The period averaged 15.2 units. The state has been 'nil, nothing to report' throughout the period. The radio quality indices showed a classic pre-auroral enhancement pattern, with conditions being excellent up to the 3rd, then a collapse to very poor with the passage of the coronal holes. As this news was being prepared conditions were only just starting to recover. We regret that the aa indices are not to hand this week. The X-Ray flux levels, in keeping with the other parameters, steadily declined from B2.5 on the 2nd down to A9.8 by the 7th. The period averaged B1.4 units. Bartells rotation 2186 starts on the 17th of August.

Now the ionospheric data for Central France:

The F2 day-time critical frequencies at Poitiers, as reported by Meudon, averaged 7.5MHz. The darkness hour lows averaged 3.6MHz. There have been many periods of Blanketing E and other phenomena. The highs are now peaking around 20.00 hours, and the darkness hour lows around 3.6MHz.

Now the ionospheric data for the north:

The F2 day-time critical frequencies at Ekaterinberg averaged 6.6MHz, with the darkness hour lows averaging 4.5MHz. The professionals have not fared too well with the forecasting for cycle 22. So far the sunspot forecasts have been wrong, and at times considerably wrong, ever since the cycle started. The result of this is that SESC at Boulder, who are considered the best forecasters in the world, are setting up a new group to try and improve the standard.

And lastly the solar forecast:

This week, the quiet side of the sun will be moving away. Solar flux levels are expected to be about 100. The geomagnetic activity is expected to be quiet. The HF band conditions based on the radio quality indices are expected to be above normal, particularly towards the end of the week.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T Z and G7 P S series, and Novice calls in the 2 0 A G and 2 1 C E series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

>Is there another regulation which says that you must show your license to
>the FCC on demand, even if they can't prove you were transmitting?

Well, when applying for a license as this woman was doing, she'd have to
fill out a form 610, which requires you to attach a copy of your current
license when applying for the test unless you're applying for a new
license. I would think the VEs would want the 610 filled out and the
license attached before testing her.
My presumption when reading the original post was that she didn't attach
or otherwise acknowledge the existence of a prior license with her name on
it, and was applying for an "entry-level" license (can one "upgrade" to a
code-free Tech license? Had she had a Novice, it would have been a natural
thing to take the code credit and get the 10 meter privileges.).

Sorry, but email kept on bouncing...

>So the short answer is that they could suspend *any* and *all*
>licenses you may hold if they find you without the proper documents,
>or if you refuse inspection.

True, in theory but in practice it is a little different when you are portable. If you refuse inspection, the FCC has no way of knowing WHICH station you actually are. In a home or mobile, it would be possible to track down the information via alternative means (i.e. home address, license plate of car) but when portable, no such means exists.

As a citizen of the US, you are NOT required to carry around ANY form of identification.

It was changed later in 76. The first time I took my extra in 76 it was
one minute of copy. When I finally passed it, later the same year, it
was the multiple choice test. Why it was changed I don't know but it
sure made the test a lot easier to pass.

Coded groups? Plain text was used out here on the east coast. Around 77-78 or so they switched to the ten question style code test, it was still administered by the FCC. You weren't supposed to go back and back fill, but I remember not being under much scrutiny when I took the test (I was sitting with headphones at a slant top school type desk on the far side of the room from where the test proctor lady was).

Since then they've switched over the volunteer examiner session where it's up to the VEC's to design rules for the code tests. The ARRL currently sends about six to seven minutes of a QSO and then has a fill-in-the-blanks type test (you can still qualify with a minutes of solid copy). In addition, the VE's are encouraged to make accomodations for the handicapped and may alter the tests further to make it easier. The FCC rule pretty simply says you have to receive by ear, use all the characters, and the examinee can't know what the text is in advance.

Yes, one can often find Jon, KA0ZFX, on HF, and he is always willing to give very helpful advice. I have worked him on 80, 40, and 20 with ease. His installation is featured in "The Mobile HF Handbook" by Dave Ingram, K4TWJ. This book is widely available, and I highly recommend it for anyone who is interested in going HF mobile. There is something in there for everybody. Hope to work you all HF mobile someday!

One interesting thing I picked up when I was flying at a
controlled field in Northern NJ:

I was coming in for landing, and the airport had an automated information
system (ATIS). Frees up the controller from telling each aircraft what
the winds are, etc. It's on a separate freq from tower freq.

ANYWAY, the ATIS said that this was information Kaybek (Kaybec?),
it didn't sound like Quebec. I called into the tower, and said I
had no idea what letter Kaybec represented. The controller laughed
and said that was how he was taught to say "Quebec" at FCC controller
school. I've heard it occasionally pronounced that way since then,
but it's rare.

For your info/amusement/scorn/whatever.

I've done (mostly informal) training with the crew in my area. The weekly check-in nets that we have are a really good way of identifying the committed members of the team and also they are good training for net situations. We participatre in twice-annual county-wide drills and whatever other exercises we can work into.

Many of our local RACES/ ARES folks have also received training through the California Department of Forestry VIP communications teams. They have been taught two VERY useful classes: an 8 hour OSHA Haz-Mat "awareness level" class and an introductory class in the Incident Command System. I highly recommend these two classes. It's important to have the trust of the public safety agencies that your folks won't cause more trouble than they prevent!

Others that I would encourage are some level of first aid/CPR; and Red Cross classes in sheltering or disaster assessment. I also advocate attending some training sessions or drills of your local hazardous materials team or disaster planners... Make your organization a familiar part of THEIR plans.

Hello Folks.

I'm using an antenna tuner that requires a balanced coax input...That's nice, except now I've just purchased an amp, and was wondering if it will cause me death or the rig's or the amp!

Here's a little more detail...

I'm feeding my balanced antenna tuner with a balanced coax line (made by 22 turns of coax around an air core). I want to place that balanced line between the rig and the amp, and attach a straight piece of coax between the amp and the tuner...Will that idea hurt me, the amp, or the rig? And will the line still be balanced by the time it gets to the input of the antenna tuner?

I feel that this balanced input to the amp idea won't make a damn bit of difference, BUT you may know better!

Please let me know.

Thanks,

Marc DePaul

[First, the ObFlame]:

Uh, wrong thread guys! You know, I think someone's got a program monitoring incoming news looking for keywords like "code", "cw", etc. then auto-posting a flamebait reply. Can't we discuss CW on this net without people turning it into yet another pro-CW/anti-CW flame war? The originator of this thread was just asking a few CW-related questions, there was no opinion expressed one way or another as to the relevancy of CW to incentive licensing!

[Now the CW questions]

Bruce Perens KD6ODT writes:

>1. Am I doing something really wrong? Progress comes very slowly. It's
> getting rather frustrating.

First let me point out that I am not yet an extra class, but I have been able to copy 20 wpm code. Yes it does come slowly, but it is not a steady improvement but rather a series of plateaus. I have noticed that my biggest speed increases seemed to occur coincidental with CW contest operating. Unfortunately as of late I have not had time to get on the air much (not even once in the last month) so I'm afraid I won't be able to copy 20wpm when I do get back. I should've taken the extra code exam right after FD ;-)

>2. I see claims about people copying at astounding rates, some claim 75 WPM.
> Can these people copy random character groups at this speed?

Can't speak for this one.

>3. Do most hams who copy at 20 WPM only recognize "the usual QSO words" at
> that rate? I suppose it's enough to pass the test, but I'd hate to be able
> to say nothing more than WX HERE IS HOT RIG IS FT-301D ANT IS ISOLOOP TNX
> FER NICE QSO OM 73.

Certainly the most commonly-used words will be the ones you copy the easiest, simply because you hear them so often you recognize the entire word. I still have difficulty with longer words, but less so if I write down at least some of the letters.

You sort of answered your own question...if it's enough to pass the test, then it's enough for now. Once you pass the test, and get on the ground floor of 20 or 40 meters, you will definitely improve your skill beyond the canned QSO level.

>4. Is there a "Farnsworth" variation where it is the word space that is
> lengthened rather than the character space? I would think that this would
> aid training in word recognition. Is there any PC software that implements
> this?

The SuperMorse program I believe has selectable word spacing. I've never made use of it; I found that word recognition happens naturally for the shorter, commonly-used words. I don't think it will ever happen for the less-commonly-used ones. I personally find I can copy at much higher speeds when the other operator uses short words; if he starts waxing eloquent I have problems.

663. suggestions for tone-detector circuit

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-12 21:44:08 UTC
From: chinatti@phoenix.Princeton.EDU
Message-ID: <1993Aug12.214408.24795@Princeton.EDU>
Source record: 277920

I am looking for advice on building a circuit that I can use to decode 2-tone sequential alert tones (i.e. Motorola Quick-Call II) off of the audio output of a receiver. I tried out the NE567 PLL tone detector, but it just doesn't have the center frequency stability OR the narrow bandwidth that I am looking for. I guess I'll have to move up a step and look into some kind of active filter (bandpass) that is tuned to peak at the frequency of the tone I am trying to detect, with a pretty high Q so I don't get false activation. My first question is does anyone have any suggestions on a good (possibly active filter, maybe something else) IC that can be used for this type of application? I would like to keep the complexity/number-of-components/cost low, but that is not a HUGE concern. Also, is anyone familiar with the scheme that Motorola uses for their Minitor (or similar) series pagers for tone-decoding?

Thanks in advance,
Steve

ZCZC AE69
QST de W1AW
DX Bulletin 43 ARLD043
~From ARRL Headquarters
Newington CT August 13, 1993
To all radio amateurs

SB DX ARL ARLD043
ARLD043 DX news

Thanks to W5KNE, QRZ DX, VP2ML, The DX Bulletin, KK4HF, K2WK, WA2UUK, KE2CG, W2FGD, G0TIW, OH2BUA and the European DX PacketCluster network for the items in this week's bulletin.

IRAN. 9D5CW has been on the 14247 kHz net recently. He has also shown up on CW at 0425z on 14017 kHz. QSL to Najib, Box 24754-154, Tehran, Iran.

CAMBODIA. VS6WV will operate as XU6WV for a week starting August 21. The WARC bands and 80 and 40 meters will be given extra attention.

EGYPT. Buzz, SU1CS, is active most nights on 14247 kHz SSB. QSL via 9K2CS.

TOGO. F9GL still has 5V7WT logs from June 3, 1970 through September 27, 1977, and will help anyone still needing a QSL for this one.

MONGOLIA. JT1CS and JT1/KB9IBZ are planning to be on from JT3 for one week starting August 26. Listen for them on 80 through 6 meters with CW, SSB and RTTY. QSL via JR0CGJ. JT1CC has been worked on the 14226 kHz net at 1616z.

MALAWI. Ely, IN3VZE, will sign 7Q7CE from August 15 through September 10. QSL his home call.

WALVIS BAY. ZS9/DJ0WQ reports their group netting nearly 10,000 QSOs, though only between 200 and 300 were with stateside stations due to poor propagation. He says to check 30 meters around 0630z and 14280 kHz around 1600z.

ALAND ISLANDS. OH2BAP, OH2BEJ, OH2BMY, OH2BUA, OH2KM, OH2KIF, OH2NGS and OH2ZA will operate club station OH2EW as OH2EW/OH0 September 24, 25 and 26. This operation from IOTA EU-002 will be a single station affair on 80, 40, 20, 15 and 10 meters with SSB only. They will be participating in the Scandinavian Activity Contest.

QSL to CBA of OH2EW.

PREFIX HUNTER NOTE. According to Guy, KE2CG, the OO prefix is being used by some Belgium stations through the end of August.

W1AW/4? Yes, W1AW will be signing /4 from the ARRL National Convention in Huntsville AL this weekend. QSL via N4PYD.

THIS WEEKEND ON THE RADIO. The European DX Contest, aka WAE DX test, sponsored by the Deutscher ARC, runs for 36 hours starting at 1200z on August 14. For details check page 110 of July QST.

+The state of California requires, by law, that you carry some form of
+ID with you. When I was a minor, I was reminded, very sternly, of that
+law by a police officer (it's little incidents like that which one
+remembers for a lifetime....)

Don't take this the wrong way, but:

Police typically have a vested interest in lieing or
strtching the truth in order to keep themselves in
power. Personal experience on my part indicates that
the police are typically ignorant of the laws, or
ignore them, relating to weapons, law, etc.

It is my understanding that until fairly recently there
was NO requirement to carry ID, if you were not operating
a motor vehicle. Urban legend has it that there is at
least one excentric individual who goes around w/out ID
deliberatly, and who then sues municipalities when he's
harassed about it.

The fact is that here in CA, until about 2 months ago, you
could walk around, or ride a bike, w/out ID. The Supreme
Court found however, that in a kindler, gentler, nation
that everyone has to carry ID at all times, or they may
be held for (as I recall) up to 48 hours to confirm their
ID.

Bruce Perens (bruce@mongo.Com) wrote:

: 1. Am I doing something really wrong? Progress comes very slowly. It's
: getting rather frustrating.

One suggestion: Occasionally put down your pencil and try copying in your head at 25 or so wpm. Don't worry that you are missing much of it -- just relax and try to get the gist of the text. This will force you to get out of the "copy by letter" mode and into the "copy by word" mode which is what you need at the higher speeds.

: 2. I see claims about people copying at astounding rates, some claim 75 WPM.
: Can these people copy random character groups at this speed?

I remember years ago listening to some of the high-speed code boys down on the low end of 40 meters. I copied their 70 wpm sending on tape and played it back at 1/2 speed to see what they were saying. I was amused to note that neither one of them managed to correctly copy the other's callsign during the entire QSO!

: 3. Do most hams who copy at 20 WPM only recognize "the usual QSO words" at
: that rate? I suppose it's enough to pass the test, but I'd hate to be able
: to say nothing more than WX HERE IS HOT RIG IS FT-301D ANT IS ISOLOOP TNX
: FER NICE QSO OM 73.

A good CW op can easily copy any normal English text at 20 WPM. Certainly the prevalence of common words makes the job easier. For the longer words, you tend to copy by syllable. In a CW QSO, when you hit an uncommon word, like "syllable," it takes extra concentration, but no big deal. I am a bit rusty, but I think I could copy this posting at 40 wpm CW with little difficulty.

: 4. Is there a "Farnsworth" variation where it is the word space that is
: lengthened rather than the character space? I would think that this would
: aid training in word recognition. Is there any PC software that implements
: this?

One problem with Farnsworth spacing is it tends to disguise the difference between character and word spacing. (They are both so long it's hard to tell the difference.) You could write a simple Unix script or BASIC program to double or triple all the spaces in an ASCII file to add extra spacing between words.

669. 2m HT range; Repeater coordination;Use in AC

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-13 03:31:26 UTC
From: bdavidso@nyx.cs.du.edu
Message-ID: <1993Aug13.033126.1206@mnemosyne.cs.du.edu>
Source record: 277892

The question on "range of the little 2W HTs" has a lot in common with the discussion titled "Repeater Coordination". The front end circuits on modern radios are soooo good you can hear signals that used to be way way below the capability of ham receivers. Combine that with a reasonable antenna and you have some pretty good range possibilities. If a signal path exists, modern commercial & Ham gear will probably hear the signal.

For example: I routinely work stations to the approximate "theoretical" radio horizon from a small plane flying at 7000 to 12000 feet AGL (above ground level) on 2 watts in the 2 meter band. That computes to something like 118 to 155 miles. Usually full quieting.

The installed aircraft radios (operating in the range 118-132 MHz) with 10W output don't have anywhere near that sort of range when communicating with ATC (air traffic control) - BY DESIGN. The front end on aviation radios is much less sensitive than 2M gear just to prevent a lot of the long range stuff we're talking about. ATC wants PREDICTABLE communication from a given altitude to ground sites using VHF. So they use predictable power and "less than state of the art" front ends to cause range to be predictable in most all conditions.

Hams have a different goal, so as the capability for lower & lower noise figures evolves (largely driven by the satellite folks) the rest of us benefit as "new generation" front ends replace older ones.

Source record: 277896

Bravo, Dave! I too own a Standard C168A and am dismayed that more people don't look beyond the same old shit when buying an HT. Today, most HT's have the all the bells and whistles, the trick to finding a great HT is in the margins. How long will the battery last? Will I get so much intermod that it's useless on anything but the dummy-load rubber duck that came with it? These are the kinds of questions people should ask when buying an HT thesedays, but how many people do? I always hear people complain about the intermod on their TH-78A or DJ-580 and crappy battery life on their Icom. Well, before you plunk your hard-earned money down, look at what you're buying. An Alinco that gets so much intermod that you can't use it on an external antenna is not a great rig, no matter how cheap. It's nice that a Yaesu FT-530 has 82 memories and dual in-band receive, but what good is that if all you can hear is intermod? The same holds true for the TH-78A, despite it's built in arcade game. The test of an HT is how well you can use it, and the Standard has thus far exceeded all of my expectations, as well as the advertised claims made by Standard. It's also built like a brick shithouse.

Good Luck,

Scott, N9AAT

674. What is the next group of calls for Techs.?

>Also, this feature of a separate receive antenna, Is it available in most
>of the rigs, or it is a special feature?
>

It is common to use a separate receive-only antenna on the low bands
(160m and sometimes 80m) for noise reduction purposes. On the higher
bands, use of separate antennas is infrequent. Unless you work 160m
(and have space for multiple antennas, like a Beverage) you are not
likely to need this feature. However, the separate antenna is
associated with with another FT-1000 feature, the dual receivers.
If you want to work one band and monitor another, you might well
have different antennas for different bands. Incidentally, I have
owned an FT-1000 for about two years, and have been extremely
pleased with it. I use it for RTTY and CW DXing primarily. It is
an excellent DXer's rig. My previous rig was a TS-940, and the
FT-1000 beats it hands down. Of course, the FT-1000 isn't cheap,
and you can probably find something nearly as good for a lot less.

Hi,
I saw an ad for a new HF modem by HAL , called CLOVER. It seems to
have very good technical specifications. Is anyone out there using it?
If so, does their proprietary mode (4 carriers with 4 bits/baud each)
work well?

Try the heavy J&J dental floss. I find the waxed duplicates many of
the older dial cords rather well. And it gives your radio a fresh
minty taste. :-)

Welcome to the sixth exciting, thrill-packed issue of Condo Communicator, a newsletter devoted to those amateurs who, for various reasons, must configure their stations to operate from restrictive areas such as condos, apartments, townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile homes, or wherever they fry their burgers and call QTH.

TABLE OF CONTENTS

Soapbox..... Block 1

Station Descriptions..... Block 2
K6XO, KK6NR, KC6ZTT

Congratulations to AE0Q..... Block 3

Technical Correspondence..... Block 4

Bibliography..... Block 5

BLOCK 1
Based on my personal experience and from your reports, it seems that living in a condo or in a "restricted" neighborhood isn't much of an impediment to ham radio activities. In fact, it can be used to your advantage, especially if you live in a high rise where you can put up an antenna without having to install a tower!

Let's take a moment and compare shacks...those in a condo and those on a city lot. How do they compare?

HF Condo/Restricted	City Lot
Antennas Bent dipoles & end-	Same + rigid-metal beams.
feds, wire beams,	
DDRRs, loops.	
EMI Since few places for	Probably more folks with
TV antennas, most outdoor	TV antennas, so
folks use cable. TVI can	still be a
Those using rabbit	problem.
ears are a	problem.

Telephones a problem, Ditto.
as are stereos &
other appliances.

Grounding Lack of good gnd means N/A
using artificial gnds or
long runs for true
RF gnds. Can mean
lots of RF in the
area and coupling into
power mains for common
mode EMI problems.

VHF/UHF

Antennas 28-144 MHz, lower Can be put high on towers.
gain antennas fit
nicely in attics
or in outdoor nooks
and crannies.

>144 MHz, attenuation N/A
of signals trying to
penetrate wet shingles,
etc.

High-gain antennas N/A
won't fit (EME dishes,
ATV antennas, sat-
ellite antennas) so
must go temporary,
portable, or work a
deal for outside
installation.

You get the idea. Unless you're into the exotic modes in the VHF+ parts of the spectrum, or have notions of making the DX honor roll in record time, then you won't have too much trouble enjoying most ham pursuits. You're going to have to work harder than most folks to keep down RFI. And if you live in a garden-level or basement apartment with no windows, then a deep-cycle battery, a good transceiver, and a mobile antenna affixed to a used van make a dandy portable shack.

The true old timers out there will remember when a radio shack was a shack...usually out in the back yard. So what's so horrible about putting your station in a van or some other mobile/portable setup? If for no other reason, it would give you ATVers a chance to show off something besides the same old views of your den! And if you want to operate 10 meters without TVI problems, it's not too difficult to roll that mobile rig over to a park and operate. In any case, the FCC lets us use the airwaves mainly because we're handy to have around in emergencies, and that means practicing emergency procedures and putting together a good, portable station. So get with it! Travel light, operate quiet.

Time for me to jump off the soapbox and let a few of you describe your station setups.

BLOCK 2
STATION DESCRIPTIONS

Alan Brubaker, K6XO, of Draper, UT has a couple of interesting descriptions.

The Condo Loop Antenna

A few years ago we lived in a condo in California. The usual situation - no antennas allowed. Fortunately, each condo had a small backyard with which you could do more or less what you wished. I decided to try a loop antenna in the small backyard. One corner of the loop was hung at the roofline of the two story building, and the corners of the loop were attached to the 6 foot fence on either side of the backyard. I cut the loop for 20 meters (about 68 feet), and it just fit - it was roughly triangular, and sloped away from the building at about a 45 degree angle. I fed the loop directly with RG-8 coax with no balun. We had cable so no TVI problem. The antenna tuner in my TS930 could tune this arrangement 40 through 10 meters, and I was able to make contacts on all of those bands, but of course it worked best on 20. I used #24 speaker wire which was nearly invisible. Never had any complaints from the neighbors either, but they probably did not know that I was even on the air.

The Fishing Pole Portable Antenna

About 30 years ago, a friend of mine, K6RU (sk), then W6HJT, made frequent trips to Hawaii. While he was there, he stayed at the Surfrider Hotel on Waikiki Beach, and he always got a suite on the top floor. He ran a KWM2 and a 30L1 amplifier to a "Fishing Pole" antenna. He had a deep sea fishing rig, and wound on the reel was bare copper stranded wire with a 2 pound lead fishing weight tied on the end. He hung the fishing pole out the window and reeled out the appropriate amount of wire for the band that he wanted to operate on. (He had measured the wire before the trip and marked it with tape for 80 through 10 meters). He clipped the center conductor of the coaxial feedline near the reel, and he clipped the shield to a pre-cut counterpoise which was run along the baseboard of the room. The wire fishing line and the counterpoise thus formed a kind of dipole antenna which worked surprisingly well. The combination of being 150 feet above the beach and the 600 watts was enough to overcome the deficiencies of the antenna system and he got out quite well. This approach could also work from a high-rise apartment building, if you

are not on the ground floor, that is.

Alan reminds us that it's pretty easy to be heard, even with low power and a less-than-ideal antenna setup, given a clear frequency and good propagation. He says to continue experimenting. Alan continues:

I have talked to countless operators, mostly on 10 meters, who are using all sorts of indoor and clandestine antennas. I even talked to a fellow in Florida one day who was using a ground mounted DDRR and he had a surprisingly good signal. AEA and MFJ have come up with their compact loop antennas which are also useful in restricted situations.

Walt Spector, KK6NR, of Sunnyvale, California, operates most of the ham bands from his condo. At the time of his first installation, he was on the board of his homeowners' association and had helped reduce some TVI from the community's hot water heater by putting some ferrite around its power line.

I first installed a 120' long wire and used a tuner. It was invisible, but living on the second floor I could not get a good ground. Thus, it generated a lot of RFI and I did not use it.

My second antenna was a Cushcraft Ringo half wave for 10 meters. This was cheap ($40) and I figured it would test the waters for a more extensive system. I ran the coax off the roof and into my upstairs window. Almost no one noticed.

Buoyed by this success, I bought a Cushcraft R7. Again no one noticed any major difference. First QSO on 40 meters was a local, second QSO was in Italy. I was now on 7 bands!

I then happened to need 80 meters. I built a 130' dipole and fed it with twin lead, running the twin lead into the same window as the coax. Things were starting to get visible, but no one said anything. This antenna also seemed to work ok on 160 meters. (First QSO was Los Angeles, 500 miles.) All 9 HF bands - great!

Then our complex needed a new roof. The president of the Homeowners Association asked me to take down my stuff to get it out of the roofers' way. (The timing was perfect because we needed the R-7 for Field Day.)

When I went to put it all back up, I was stopped. By this time I was no longer serving on the board. There was an objection to my coax going off the end of the roof, and also my walking on this brand new and very expensive shake roof.

So I proceeded to enlist the support of the two board members (of 3) who did not object to the antennas. I wrote a letter to the board explaining how I needed the antenna for my volunteer participation in the local ARES/RACES organization (which is true - our nets are on 10 meters). I also got the president of the local organization to write a letter confirming this. The letter asked for 'temporary authorization' so as not to conflict too badly with the covenants.

The board finally approved the antenna with the provision that I run the coax through the attic and a vent pipe. (The roofer and I had discussed installing a vent pipe at a certain strategic spot...) Since I live upstairs, I could run the coax into the closet from the attic.

So the R-7 is back up and I am fairly happy. But I am sans 80 and 160. My next project would be to use a remote coax switch and up something simple on 2 meters and 440, except that I will be moving soon. The house we are closing on was contingent upon lack of antenna restrictions in the covenants.

Moral of the story? There are several:

- Get on the board of the Homeowners Association so that you can be a decision maker - not a complainer.
- Get active with local ARES/RACES so you have a legitimate need for the antenna.

- Be sure that appearance is kept neat. In my case, the major complaint was about the *coax*, not the antenna itself.

- Use non-obtrusive wire and vertical antennas. Save the multi-element yagis and dishes for your mid-life crisis.

- Be very helpful about RFI and tell everyone how great cable TV is.

- A condo can actually be an advantage if you play your cards right. My antenna is 50 feet high with no tower.

- If you are buying a property, make your offer contingent upon the examination of the covenants for antenna restrictions.

Rob Ontiveros, KC6ZTT, of San Jose, CA, wrote in to describe his station in his two-story condo. He operates from his garage and uses a 40-meter

vertical constructed of PVC pipe. Rob raises the antenna when he wants to operate and then takes it down when finished. Generally he's on the air late at night or early in the morning, operating mostly 40-meter CW, at about 50 watts. At higher power levels, he interferes with his TV, and his wife gets annoyed! Rob was anticipating a six-week sabbatical when he could operate 15-meter CW.

Rob also operates VHF/UHF, using a dipole antenna on 5 feet of PVC strapped to the porch with bungee cord.

However, he has been thinking of going HF mobile so he can operate at better hours for chasing DX. Rob would like to hear from people who have used the Outbacker or Spider antennas for mobile work.

BLOCK 3
CONGRATS
I'd like to congratulate a friend of mine, Glenn, AE0Q, of Denver, Colorado, who is soon to submit his QSLs for DXCC RTTY. It took about 2 and a half years, and he operates from a townhome, too! Glenn uses a fan-type dipole, with the longest element full size on 30 meters. The antenna is fed with heavy-duty twin-lead and a tuner. Glenn's favorite mode is digital stuff: RTTY, AMTOR, and CW.

BLOCK 4
TECHNICAL NOTES

The ARRL has a pretty nifty electromagnetic interference pamphlet that they will send to ARRL members. It's a reprint from the February and March 1992 issues of QST "Lab Notes" and was written by Ed Hare, KA1CV, Senior Laboratory Engineer. In addition to troubleshooting techniques (always proceed from the easiest solutions to the most difficult), hints on diplomatic dealings with neighbors, and some good theory (like distinguishing between differential and common-mode interference), Ed includes a long, long list of sources for filters and components. This looks like the EMI package to get and keep close at hand, especially if you're using indoor antennas.

EMI/RFI Package

BLOCK 5
BIBLIOGRAPHY

I dug out some old magazines and perused them for stuff interesting to us condo types. If you don't have these magazines poked away in the bookcase, call up your local public library (and those public universities and colleges, taxpayers) to see if they have back issues. If they have a copying machine, you're in business. You can also write to the magazine publishers and order back issues, too.

Don't forget to submit references you think the rest of us might find useful.

Newkirk, Rod, W9BRD. "Honey, I Shrunk the Antenna!" QST, July 1993, p. 34. A neat article on miniature, multiturn loop antennas. If you can't afford one of the commercial miniature loops, think about building one of these things out of wire. For example, the loop for 160/80 meters is composed of four turns of wire, one side 3.5 feet and the other 4.5 feet, with two variable caps and three fixed caps. One guy's been using the 40-meter design from a room largely below ground. I'm not *that* cramped for space, but something like this sounds like a dandy portable antenna.

Johns, Robert, W3JIP. "How to Build an Indoor Transmitting Loop Antenna: Part I--10 and 20 Meters," CQ, December, 1991, p. 30. If you're pretty handy with cutting and fitting copper pipe, here's some more miniature loops you can build. The author operates these loops from indoors. I know I've seen part two of this article around here someplace...time to clean the shack! I assume it was in the January, 1992 issue.

Auld, Bruce, NZ5G. "The Irrigator's Special: A Free-Standing, Collapsible, PVC Vertical Antenna," CQ, April 1992, p. 38. This little antenna consists of several sections of PVC pipe. Two of the sections connect together to form the vertical 10 feet of support for the helically wound wire. The other PVC pipe sections screw together to form a support foot for the antenna (shaped like an "H" laid flat, with the vertical section screwed into the middle bar of the "H"). The amount of wire is calculated from the old standard 468/freq in Mhz (half wave). String out two radials and you're in business. The article contains calculated lengths for all wire elements (including radials) and why 1/4 wavelength elements worked better or worse than 1/2 wave elements on some bands. Another nifty portable antenna, but one that most of us could squeeze into an attic for some low-angle radiation.

Okay folks, let's hear from you! Send your notes, ideas, station description, war stories, and so on to me at:

The Standard is almost $100 more than the Yeasu FT-530 (Current AES catalog
Standard C-228A $540, Yeasu FT-530 $450 (but I bought mine for $429 @HRO)

I don't have any intermod problems with my FT-530 in normal use. It has an
incredible number of useful features including things like back-lit keypad,
voltmeter, and tx & rx power savers that no one else has. I dont call these
types of features "bells & whistles" because they are truely useful. I dont
think anyone can argue that if you can't control your urge to own a nwe HT,
that the 530 is the absolute best buy around toda, bang for buck-wise or
feature-wise.

It *used* to work that way though. There was one permanent license, General, and it was good for all amateur privileges. (Well, Tech *existed* but you rarely met one.) Then the ARRL lobbied the FCC and changed things to the complex mess we have today. And IMHO things are *not* better as a result of 5 different permanent HF license classes rather than one. It's just a caste system with no demonstrated benefits to the amateur service.

What kind of tuner requires "balanced" coax? By definition coax is unbalanced
line and an air core balun doesn't change that unless the connector on
the tuner is "floating" with respect to the chassis. I wouldn't want to
touch such a tuner while running any power, the possibility of nasty RF
burns would be too great.

En francais, on prononce "Que'bec" comme "kay-BEC". Silent "u".

It's not rare at all in Montreal.

(It means "place where the water narrows." It's Algonquin, if I
remember correctly.)

What gets me is that the phonetic alphabet insists you drop those
final r's, which I categorically refuse to do. ("VIC-tah")

685. Mobile xmitters and Auto warranties

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-13 15:28:43 UTC
From: "kevin.jessup" <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1993Aug13.152843.19874@mixcom.mixcom.com>
Source record: 277848

Sorry if this is a regular topic, but I've been away from the net for
a while...

I've heard stories of higher power (35 Watts an up) mobile 2-meter and
70cm rigs causing the microcomputer based engine control modules in
automobiles to fail. I've also heard that the warranties on these
units are void if you have a ham mobile rig in your car. Is this
true and if so, which automobile manufacturers?

I have a Honda, a Toyota and am considering the purchase of the
Mercury Villager minnyvan (yes, I'm married and have kids). :-|
I'd like to get a couple of mobile rigs but don't want any
problems. Currently, I'm just using low power (6 watts max)
HTs connected to the cigarette lighter and mag-mount antennas.

Are such "exclusions" actually "in writing" in the warranties?
How can they have such poor resistance to RF?
What is the point of RF entry into the engine control unit? Is it
radiated RF or is it through the car's electrical system?

If you live in a rural area, or anywhere away from the very few big cities that have a ham radio retail outlet, you'll buy retail. In the State of Washington, there are retail ham stores in Seattle and Spokane. For people living anywhere else in the state, mail order is usually the only realistic option. Remember, in the Western U.S. it's hundreds of miles between cities!

Also, if you work 11-12 hours a day like I usually do, I don't have time to go "shopping" so I tend to order most everything mail order since it saves me tons of time.

Oh, you could buy an HT at Radio Shack, I suppose, but that certainly limits your options.

I just ordered an ICOM W2A from Texas Towers for $439.95. I previously ordered my Tri-Ex tower through them. AES wanted $499.95 and Ham Radio Outlet wanted $479.95. According to AES, the IC 24AT has been discontinued by ICOM and AES has sold out of their stock. Other retailers still have the 24AT in stock (Texas Towers was $379.95, I think) (My wife has a 24AT and I'd highly endorse it as good solid radio).

688. Why need a separate Antenna for receive ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-13 15:52:01 UTC
From: mohan@tulip
Message-ID: <1993Aug13.105202.5369@uoft02.utoledo.edu>
Source record: 277912

Hello,

Yesterday I was reading the review of the Yaesu FT-1000 in QST. It was mentioned that the transceiver has the option to have a separate antenna for receive.

What is the use of a separate receive antenna ? It seems to me that the operator may use an omnidirectional antenna for scanning the band and use a directional antenna for the QSO.

Also, this feature of a separate receive antenna, Is it available in most of the rigs, or it is a special feature?

Thanks for any info.

If you're going to be up north of Boston at all, you might try the 147.12+ machine, W1DC, which is located in one of the Bull office buildings in Billerica (the very one from which I'm sending this note, in fact -- notice the headers above :-). It seems to have very good coverage; I've received it in Boston with no problem, as well as almost all the way up into Manchester, NH when I went up there to the ARRL NE Division Convention. It's a friendly machine, and unless it's morning or afternoon drive (commuting) time, it won't be busy at all. In fact, that's the one problem you may have. :-) Give it a try!

Looks like great weather for the Huntsville Hamfest ARRL Natl Convention. It rained this morning but the sky is clearing and it should be gorgeous.

This is pretty exciting. The talk in is underway and there are people comming in from all over the country. The Hilton, Marriott and Radison are full. The over flow is going to hotel row.

The talk in is on the 146.94 repeater. Doors open Aug 14 at 9:00 AM. Should be a great event!

There are other reasons for separate receive antennas. Consider low band
operation. Some folks load up their towers for 160 meters. This works very
well on transmit, but the noise level (static) can be very bad on verticals.
So some people use Beverage antennas (long, terminated wires) which are
fairly quiet and very directional, but aparently not very good on transmit.
So that is a way to work DX on 160 and not go deaf. Having the rig be able
to switch back and forth from the xmit to the receive antenna is then quite
helpful.

>
>Also, this feature of a separate receive antenna, Is it available in most
>of the rigs, or it is a special feature?
>
The Yaesu FT-990 (and probably the 1000) also has provision to hook a second,
outboard receiver to the receive antenna system. Used this way, the T/R
switch in the transceiver can also mute the RF going to the second receiver
when transmitting. This keeps you from blowing up your second receiver...

: The Standard is almost $100 more than the Yeasu FT-530 (Current AES catalog
: Standard C-228A $540, Yeasu FT-530 $450 (but I bought mine for $429 @HRO)

: I don't have any intermod problems with my FT-530 in normal use. It has an
: incredible number of useful features including things like back-lit keypad,
: voltmeter, and tx & rx power savers that no one else has. I dont call these
: types of features "bells & whistles" because they are truely useful. I dont
: think anyone can argue that if you can't control your urge to own a nwe HT,
: that the 530 is the absolute best buy around toda, bang for buck-wise or
: feature-wise.

Maybe considering the price difference most people consider the FT-530 a much better deal than one of the STANDARD dual banders. I probably would too if I was going to purchase a dual band HT. I have used a friends FT-530 and found it to be a nice radio as far as dual banders go. However I was not in the market for a dual bander and price wise my STANDARD C168A competed head on with all the other similar featured 2 meter HT's out there. Thats where IMO the similarities end. In terms of size to features ratio and overall performance and quality my C168A puts the competition in the dust. Also, when placing my friends FT-530 next to my C168 listening to the same repeater my C168A sounds much much much better.

So, if your looking for a dual bander the FT-530 probalby is the best deal overall but if you are only looking for either a 2 meter or 70cm HT you are selling yourself short if you don't consider the STANDARD C168A or C468A.

Well, here is the story. I am going to work on an article
for December QST on Mobile HF (not just QRP..sorry). I have
come to conclusion that all information that is available on
about any ham question is in someone's brain that is on this
list. I would value greatly any suggestions, comments and
experiences on this subject and:

1) wiring up a mobile rig(installation..brackets electrical
system concerns, paticular brand car problems.. like with
car computers)
2) mobile inteference problems
3) good hf mobile rigs and why
4) mobile antennas.. specs.. what is best and why.. personal
and quantitative info (not quoted from sales material)
5) rewards and pitfalls of mobile
6) operating tips
7) Mobile and RV nets (bands, freq.)
8) other stuff people are interested in reading.

thanks for any help.

|> psr@acsu.buffalo.edu (Strider) writes:
|> : Is it possible to have a system that can transmit and receive
|> : at the same time?

Having both sides transmit and receive at the same time is called "Full Duplex". What we use most of the time is called "Half Duplex", because only one half of the conversation is active at a time. Full Duplex radio systems use two frequencies, one for each side of the conversation to transmit on.

You might have meant can both sides transmit and receive simultaneously _on_the_same_frequency_ when you said "synchronous" That's not practical.

My Alinco DJ-580 dual-band HT will do full duplex cross-band if the operator uses an earphone (to prevent feedback), and keys in the command to make the cross-band receiver operate when transmitting. One party transmits on 2 meters, one on 70 cm. Other dual-band HTs do this as well, I've seen one HT that's built like a phone handset and does full duplex reasonably well without the earphone.

under old pre-VEC procedures with two general class
or above licensees)

---------- cut here ----------
==========
ATLAS Radio introduces....The NEW Model 310 HF Tranceiver
for SSB, CW, Packet and Amtor.
==========

* Features DDS (Direct Digital Synthesis) Frequency Control.

* COVERS ALL 9 AMATEUR RADIO HF BANDS: Transmits and
receives from 1.8 to 29.7 Mhz, and includes MARS and CAP
frequencies. It will also receive all the HF Marine
frequencies, as well as short wave broadcasting. (Note:
As a transmitter, the 310 is designed only for amateur
radio bands. It is not type accepted for transmission
in the marine frequencies.)

* POWER OUTPUT: 150 watts PEP in SSB mode, 120 watts on
CW, 80 watts on Packet and AMTOR. No transmitter tuning
is required. Power is panel adjustable from 5 watts to
full power. Rated power output requires 13.8 volts DC
at the rear power connector with full transmit power.
Lesser voltage will reduce power accordingly.

* DIGITIAL FREQUENCY DISPLAY: 7 digit readout to 10 Hz
increments. Digits are LCD (liquid crystal display)
0.4 in. high, are back lighted for easy reading in light
or dark surroundings.

* STANDARD FEATURES INCLUDE:
a) Break-in CW keying

b) Upper/lower sideband selection
c) PBT, Pass Band Tuning control
d) Internal speaker, top mounted
e) Noise blanker
f) The DDS has dual frequency capability which
permits separate transmit and receive frequencies
anywhere in the band, as well as the advantages
of RIT

* DDS, Direct Digital Synthesis, is a state-of-the-art system for generating the injection frequency required by the receiver front end mixer. The DDS chip is a product of Qualcomm, a San Diego, California company. It provides an extremely clean and stable output to the mixer, in both receive and transmit modes. The mixer is a Mini-Circuits component which assures high standards of receiver performance. Typical Receiver Specs: .25 microvolt sensitivity, Dynamic Range: 134 db, 3rd Order Intercept: 18 dBm. There is NO PLL (Phase Lock Loop).

* SINGLE CONVERSION SUPERHETERODYNE. The DDS LO output converts the received signal to an Intermediate Frequency of 9 Mhz. A bank of 7 band pass filters provide more than 85 db image suppression. Each filter has 9 poles. Single conversion provides superior performance to multiple conversion, and enhances the KISS principle.

* SWITCHABLE CRYSTAL FILTER: Standard feature provides choice of 3 band widths: 2.7 khz for normal SSB, 1.8 khz for narrow SSB in crowded band conditions, and 0.6 khz for narrow band CW. 6 to 60 Shape Factor is 1.4 to 1 in the 2.7 khz bandwidth position.

* DC POWER REQUIREMENTS: 12-14 volts at 500 Milliamps for receive, up to 22 amps for transmit. Average with SSB modulation will be approx. 8 amps.

* PHYSICAL SPECS.: 9 in wide, 3.5 in high, by 9 in deep. Total weight, less power supply, 8 lbs.

* FACTORY DIRECT INTRODUCTORY PRICE: $795

* OPTIONS:

Power supply Console for 110/220 volts AC, 50-60 Hz $189
(plugs directly into the back)

Deluxe Mobile Mount (into which the Atlas 310 plugs) $ 69

==========
From the brochure for the NEW Model 310 HF Transceiver
(for SSB, CW, Packet and Amtor) from Atlas Radio.
==========

The History of Atlas Radio Company:

Since Atlas is again entering the HF Transceiver market,
the following is a brief recap of the company's history.
Herb Johnson, W6QKI, was the founder of Swan Electronics
in 1961, manufacturing the first generation of highly
successful SSB/CW Transceivers for the amateur radio
market. In 1967 he merged Swan with Cubic Corp. of
San Diego, and continued managing the Swan subsidiary
until 1973. Thw Swan line of equipment was mostly tube
type design, and through the years more than 80,000
Swan Transceivers were sold. A high percentage of them
are still on the air, putting out strong, good quality
signals. (The name "Swan" was chosen in memory of Herb's
dad, whose name in the old country, Sweden, was Sven, but
was Americanized to Swan when he came to the U.S.A.)

In 1974, Herb started his second company and named it
Atlas Radio (after the 1924 vintage diesel engine in the
1924 motor vessel, "Westward", owned and skippered by
his friend, Don Gumpertz, K6OF). Atlas introduced the
first really successfull all solid state transciever.
In this design he had valuable assistance of les Earnshaw,
founder of Southcom International. The original model
180 covered the 160, 80, 40, and 20 meters. In 1975,
the 210 and 215 models evolved, followed by the 210X
and 215X improvements in 1976. (The 210 series covered
the bands from 80 through 10 meters, while the 215 covered
160 through 15.) There were over 19,000 of these models
sold. They were develope under the "KISS" principle
("Keep-It-Simple-Stupid"), and the design set new
standards for high performance and reliability, as well
as being practically bullet proof. The big majority
of these early Atlas radios are still in service, and
are not easy to find on the used market.

"The Swan transceivers were what I like to think of as
my first generation of SSB HF Transceivers," says Herb.
"They were then followed by my second generation, the
Atlas transceivers of the 70's."

"And, so here we are, back again, this time with the third generation, the brand new Atlas 310. I'm sure you'll find the 310 to be as innovative and exciting as the 210 was 18 years ago, with many additional features to make it the radio of the 90's. The general design philosophy is the same 'KISS' principle, but without compromise in any area. In state-of-the-art technology, performance, and reliability, the 310 takes a back seat to no one."

73 Herb Johnson W6QKI

703. Re: Bootlegger At ARRL N.E. Convention

Well, I guess there are no lawyers out there willing to post a more educated guess tham mine, so I went to the library and looked up the statutes. (I didn't see anything in the notes about the consitutionality of FCC inspectors charging you with any of this stuff at a ham radio convention, but it's a bit of a thin reed for a defense, IMHO.)

The relevant statute is Ch 47, US Code.

Sec. 301 requires everyone to have a license. Notice that this is statutory, not a mere FCC rule.

Sec. 501 privides for up to a $10,000 fine or up to 1 year in prison upon conviction of willfully violating Sec. 301, among other things, on the first offense. It's $10,000 or *2* years for the second offense.

Sec. 502 privides for a fine of up to $500 per day upon conviction of willfully violating FCC rules. IN ADDITION to penalties under Sec. 501.

Sec. 503 provides for liability for forfeiture of up to $10,000 per occurance or $10,000 per day for a continuing occurance, up to $75,000 for one violation on the amateur bands (broadcasters and such face higher fines), for "willfully *and repeatedly*" violating either the FCC rules *or* those statutory provisions *not listed in Sec. 501*.

Sec. 510 provides that those who willfully and knowingly violate Sec. 301 (among others) can have the government seize all their radio gear. I'll bet failure to produce a license on demand would trigger this section.

Now, as to crimes and misdemeanors:

18 USC 3581 says that

<=$1000 fine is an infraction
a $10,000 fine requires a misdemeanor
<= 1 year in prison requires a Class A misdemeanor
<= 3 years in prison requires a Class E felony

So bootlegging is a crime, a Class A misdemeanor on the first offence, and a felony on second offence. Willfully and repeatedly violating FCC rules (malicious interference, etc.) is a misdemeanor. A rule violation is an infraction.

Of course, all criminal convictions require criminal trials in federal court. I have no idea how the FCC ordinarily handles these things.

I'd imagine they're usually free to impose some sort of administrative solution.

So. If I read this stuff right, our favorite bootlegger could have been arrested on the spot and charged with a federal Class A misdemeanor. And her transmitter(s) could have been seized. There were witnesses to her transmission, and probable cause is easy. Conviction or plea bargain likely.

No fun.

Subject to correction by competent authority, of course. I urge you to go look at the laws for yourself.

Side note: I was talking with a friend of mine, wondering why anyone would bother to bootleg on 2m. If you don't ID, no one talks to you. If you do, someone's bound to have a callbook-on-disk, and you'll be found out. "That's easy," she said, "she's using her husband's call."

Probably so.

>Does anyone know what the next group of callsigns will be for no-code techs.
>in the U.S. after the KD's are done? I've heard a rumor that it could be NA----
>or that they will just continue with KE----. Just wondering...thanks much.

In the fourth call area, KE4 calls have been issued since around May.
So expect to see KE6 calls before long.

: >by current usage? I hear a majority of folks sending SK at the end, so that

Prosigns are fully defined in ARRL publications. People really should read
them if they are uncertain what they mean.

: >OK, a question for all you procedural nuts: when is AR used?

I don't have the books in front of me, but unless my memory fails me (and
it wouldn't be the first time!), AR means "end of message" while SK means
"end of transmission". So you may use AR at the end of the text you're
sending, but really it was intended to indicate the end of a formal
message, especially when sending several messages during the same
transmission. The SK should ONLY be used at the end of your final
transmission to another station.

The use of AR in a CQ is sometimes heard, and I certainly don't think it
is any kind of problem, but it IS superfluous, and definitely not the
original purpose of the prosign.

: If a misinformed security guard gives you a hard time, you must be careful
: not to upset them. I have heard of some cases of people landing in jail
: for fairly innocent things, when they voiced too loud an objection. This
: problem could be extremely serious in a foreign airport.

: Life isn't fair!

Another way to look at this is from the view of the airlines/airport/govt.
1. In these times of terrorism and crazies, is it such a bad tradeoff to
inflict a trivial amount of inconvenience, even to a lot of innocent
people, to significantly improve the chances of detecting dangerous
objects? Sure, you may argue that some actions DON'T significantly
improve the chances of detection, but I doubt that we could ever get
agreement on that. I, for one, would prefer to be conservative on
such safety matters.
2. Is it reasonable to expect airport security (notoriously underpaid and
untrained) to understand ANY radio knowledge, much less HAM radio?
The airports have to give them simple rules to follow. Remember,
they have to watch out for lots of other things besides radios.

mohan@tulip (Mohan Pakkurti) writes:

>What is the use of a separate receive antenna ? It seems to me that the
>operator may use an omnidirectional antenna for scanning the band and use
>a directional antenna for the QSO.

Yes, that is one reason. Another reason is performance. On low
bands like 160m, you can get better receive performance with a
tuned, directional loop antenna. They are great for cancelling
noise and interference. For transmitting, hams generally use
verticals of some sort, usually top-loaded, for 160m. A vertical
generally has more of a problem with noise than horizontals,
so they are not as good on receiving.

>Also, this feature of a separate receive antenna, Is it available in most
>of the rigs, or it is a special feature?

Generally, this feature is not available on the lower price rigs.

708. Two-Line Orbital Element Sets (TLE242)

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-13 23:55:49 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.745286149@afit.af.mil>
Source record: 277844
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

709. Re: MERCURY Paddles by N2DAN ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-14 00:16:21 UTC
From: jkearman@arrl.org
Message-ID: <2044@arrl.org>

>I am curious to know about the paddle. So please let me know if you have
>experience with this one.
>

Steve donated a set of these paddles to W1AW. I liked
them so much I bought a set for myself. The action is
very solid and crisp. I find Bencher paddles too mushy.
I tried the British Kent paddles, but the N2DANs feel
better. The magnets really do the trick, and the
machining is quite good, so the feel is excellent. The
weight doesn't hurt either. These paddles don't move
around when you use them. For the price, you really have
to enjoy CW. If you do, I can honestly say these are the
best paddles I've tried, including FYO, Brown Bros and
Vibroplex. I haven't tried Schurr paddles.

Well, if THIS doesn't start the mother of all anti-ARRL
flame wars, I don't know what will! Gentlemen (and ladies),
start your blowtorches! (A photo of me, suitable for
mounting on a dart board, appears in the September issue of
QST. Non members, eat your hearts out!) :+\

CW Forever.

Jim, KR1S

710. Help in final HT choice

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-14 00:19:23 UTC
From: ee@lever.com
Message-ID: <CBq3KC.A7v@lever.com>
Source record: 277835

I'm in my final stages of getting a HT dual bander. My final choices are:

Alinco DJ-580T
ICOM IC-W21AT
Kenwood TH-78a
Standard C558A
Yaesu Ft-530

Beside the regular ham features I also need one thing I can't get from the published specs. I'm in a citizen's patrol that uses a repeater in the commercial band around 460. If I were to do the mod to open up Rx and Tx on the HT I would need to Tx at ~460 and Rx ~465. I don't need or want 800Mz coverage but would like to Rx all the emergency and police bands.

I've been told that the Alinco was not a better radio than the other four and the difference in price isn't critical to me.

I don't know why but the impression I got was that the Kenwood was not cutting edge, contrary opinions welcome.

When I called Yaesu they told me that their VCO would lock up over 460 but that I could get an upgrade (for $50) that would extend its coverage up to 465. That seems a bit too close to the edge of what I need so I am shying away from it.

ICOM told me that their unit would Tx to about 480 which seemed to have the right amount of margin.

I haven't gotten the information for the Standard yet.

I think it's down to the ICOM or the Standard. Any information or opinions are welcome. Also if there are any other brands or models I should consider.
--
Edward Elhauge -- ee@lever.com -- Lever Industries, San Francisco
"The goal of the working class is liberation from exploitation. This goal is not reached and cannot be reached by a new directing and governing class substituting itself for the bourgeoisie. It is only realized by the workers themselves being master over production." -- Anton Pannekoek

SB DX @ ALLBBS $RTDX0813
VK2SG RTTY DX Notes, 13 August
VK2SG RTTY DX Notes for week ending 13 August 1993 (BID RTDX0813)

If the DX notes appear short this week, I must apologize, but the
conditions as they have been for the past week, reports have been few,
and information has been scarce. Maybe everyone was chasing the E31A.
So all that I can say is that we are not up to our usual standard this
week, but we have done our best.

Our information this week came from CE3GDN, ZS5S, 9X5LJ, W2JGR,
WB2CJL, G3FZW, I5ICY, DJ3IW and the Central Europe DX-Cluster node
DB0SPC, and NJ0M node of the Twin Cities DX Packet Cluster.

Thanks to W5KNE, QRZ DX, VP2ML, The DX Bulletin, KK4HF, K2WK, WA2UUK, KE2CG, W2FGD, G0TIW, OH2BUA and the European DX PacketCluster network for the items in this week's bulletin.

IRAN. 9D5CW has been on the 14247 kHz net recently. He has also shown up on CW at 0425z on 14017 kHz. QSL to Najib, Box 24754-154, Tehran, Iran.

CAMBODIA. VS6WV will operate as XU6WV for a week starting August 21. The WARC bands and 80 and 40 meters will be given extra attention.

EGYPT. Buzz, SU1CS, is active most nights on 14247 kHz SSB. QSL via 9K2CS.

TOGO. F9GL still has 5V7WT logs from June 3, 1970 through September 27, 1977, and will help anyone still needing a QSL for this one.

MONGOLIA. JT1CS and JT1/KB9IBZ are planning to be on from JT3 for one week starting August 26. Listen for them on 80 through 6 meters with CW, SSB and RTTY. QSL via JR0CGJ. JT1CC has been worked on the 14226 kHz net at 1616z.

MALAWI. Ely, IN3VZE, will sign 7Q7CE from August 15 through September 10. QSL his home call.

WALVIS BAY. ZS9/DJ0WQ reports their group netting nearly 10,000 QSOs, though only between 200 and 300 were with stateside stations due to poor propagation. He says to check 30 meters around 0630z and 14280 kHz around 1600z.

ALAND ISLANDS. OH2BAP, OH2BEJ, OH2BMY, OH2BUA, OH2KM, OH2KIF, OH2NGS and OH2ZA will operate club station OH2EW as OH2EW/OH0 September 24, 25 and 26. This operation from IOTA EU-002 will be a single station affair on 80, 40, 20, 15 and 10 meters with SSB only. They will be participating in the Scandinavian Activity Contest.

QSL to CBA of OH2EW.

PREFIX HUNTER NOTE. According to Guy, KE2CG, the OO prefix is being used by some Belgium stations through the end of August.

W1AW/4? Yes, W1AW will be signing /4 from the ARRL National Convention in Huntsville AL this weekend. QSL via N4PYD.

THIS WEEKEND ON THE RADIO. The European DX Contest, aka WAE DX test, sponsored by the Deutscher ARC, runs for 36 hours starting at 1200z on August 14. For details check page 110 of July QST.

>units are void if you have a ham mobile rig in your car.

Well, if you do blow up the car's micro, just take the radio out and remove
the antenna, and tell the dealer "Gee, it just went and died, fix it".

Maybe using ferrite and routing the antenna coax on a path away from the
car's wiring might keep enough RF out of the micro. Besides, if your
radio can RFI the car's micro, the car's micro will QRM your radio's
reciever

: Does anyone know how 170 Hz. was arrived at? You certainly
: don't need that much shift for 60 WPM RTTY or even 100 WPM.
: Why wasn't an even narrower shift chosen? I always wondered
: about this.

Well, you have to remember that RTTY has been around for quite a while now. Back in the fifties we didn't use 20 meters much because our transmitters and receivers drifted so badly. So 850 shift was practically a necessity unless you had some kind of automatic frequency control (some guys did).

There is a carrier telegraph standard where the channels are 85Hz apart. I don't know who set that up, but in old catalogs you could buy filters for these channels - the original frequencies of 2125 and 2975 are in this series.

I remember when 170 got started, but I don't remember why it was chosen rather than 85 - probably just a compromise to practicality in an age when frequency drift was still a problem. I remember the military for a while required MARS operators to use either 850 or 85, which was a pain.

Aside from drift, there's the consideration that amateurs mostly had to use home made filters, and we didn't have active filters in those days, so the wider shift was easier to build filters for.

bobw@col.hp.com (Bob Witte) writes:
>Anyone have recent experience operating in Hong Kong?
>I will be there on business and was wondering what the
>reciprocal licensing situation is. (I've got an SASE on
>the way to the ARRL, so that angle is covered.)

Reciprocal licensing is done through the Telecommunication division of
the General Post Office. One of the main offices is at ther GPO at
Central, Hong Kong, near the Star Ferry terminal. You need passport,
license, etc. (but I don't know the details, since I haven't done it yet.)

There are a few clubs there, plus a few 2m repeaters. One is called
HARTS Hong Kong Amateur Radio Transmitting Society. It is the English
speaking (some British expatriates.) club. There are also some Australian,
Canadian and American hams living in Hong Kong (plus some tourists.)
Hong Kong people speak English, but varies in levels, and same for hams.

1) VS6KP CTCSS access
2) VS6HKA individual DTMF password access
3) VS6UTM CTCSS access or one digit DTMF access
(don't know freq.)

VS6KP repeater : 145.650 MHz (-)
VS6HKA repeater : 145.750 MHz (-)

No autopatch allowed in Hong Kong.

Have a fun trip there, lots of electronics shops in the tourists area sell
ham gears!! (but I bought stuff from a local store I know for years, since
I grew up there.) They sell both export models (American, or European) and
also Japanese versions (cheaper, manual, warranty in Japanese, no NiCDs for
HTs), so watch out and bargain. Hong Kong is duty free and tax free.

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
------------------------------------------------------------------------

This article will tell you how to find the answers to frequently-asked
Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on
the 7th of each month. This article is posted on the 14th, 21st, and 28th of
every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the
rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help
beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP
and from e-mail servers. This article contains instructions for obtaining a
copy of the FAQ. It also contains the table of contents from the FAQ so
that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ-----------------------------------

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews
------------------
If you are familiar enough with NetNews to look through previous articles on
your system, Option #1 above may be the easiest for you. The FAQ is posted
so that it should not expire from your site's news spool until the next one is
posted. Unfortunately, some news administrators do not honor the expiration
dates meant to preserve the FAQ.
```

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, FAQ updated daily
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, FAQ updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, FAQ updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, FAQ updated monthly
(Ham files mirrored from buffalo/funet/ucsd daily)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, FAQ updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

Source record: 277851

Edward,

You've narrowed your choices down to the two best dual-band radios on the ham market, as far as I'm concerned. (Although, despite my previous posting, the Kenwood is not an entirely crappy radio.) I own a Standard C168A and have also owned the C528A and C558A dual-banders. I have also owned an FT-530, and the difference between the Standards and the rest of them is in the front-end. The Standards have band-pass filtering. In fact, my micro-sized C168A has FIVE different band-pass filters. (Two low-pass filters, two band-pass filters and a crystal band-pass filter.) These filters are tuned in stages, so you can get wide-band RX without the intermod the other rigs get. The same holds true for the Standard dual-banders.
The Standards also get MUCH better battery life than any of the other rigs including the Icom W21. From my experience, I would say at least 30% better, and 40 or 50% wouldn't be much of a stretch. The C558A doesn't have dual in-band RX like the Icom, so you would be giving that up. It also doesn't have a clock or on/off timer. It IS very rugged and has great out-of-band performance. (Is this sounding like an ad, yet?) My C558A transmitted up to 478mHz, but the VCO limit is different on every rig, the average is 475mHz.
I would obviously buy the Standard, but the choice is yours. I would have kept my C558A, but due to strange finances, I couldn't. If you live in any area prone to intermod, seriously consider the Standard, because all the features in the world won't make up for the frustration of not being able to hear. I'd be happy to go into even more detail, if you'd like you can e-mail me.

Good Luck,

Scott, N9AAT

e-mail: lorit@siucvmb.siu.edu

NO, I DO NOT WORK FOR STANDARD, THEY JUST WORK BEST FOR ME.

721. 3 KW Generator for Sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-14 11:15:00 UTC
From: robert.garcia@sosinc.com
Message-ID: <2423.556.uupcb@sosinc.com>
Source record: 277780

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been refurbished and is offered for sale. The unit has a manually variable voltage output of about 16 to 36 volts at up to 105 Amps continuous operation. The generator will provide approximately 200 Amps intermediately if the circuit breaker is bypassed. These generators were originally designed to power military radio transmitters under extreme conditions or "jump start" large diesel engines in trucks and tanks.

IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5 to 30 volts at about 35 Amps per leg. The AC output is then brought through a bridge rectifier array to provide the DC power in the same manner as the alternator in your car. I have run regular 60 Hz items like a refrigerator, fan or coffee pot directly off a step up (28 v to 110v) transformer connected to one leg of the output of the generator. Higher 60 Hz voltages are available if the regulator is modified!

The generators are powered by a heavy duty four (4) cylinder air cooled industrial (Wisconsin) engine of 32 cubic inches and produce about 16 horsepower using ANY type of gasoline. The engines have a protected Fairbanks Morse ignition system designed to start and run under the worst weather conditions. This engine package is also used to power a military standard 5 KW or 10 KW 120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come equipped with a replaceable cartridge type oil filter and mechanical fuel pump allowing gasoline to be drawn from the integral 3.75 gallon tank or an auxiliary fuel tank. Repair parts are available at any auto supply outlet or outboard motor supply business. These generators were designed to be "GI proof" and have been maintained and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Providing "backup" power for solar systems.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
Conversion to 120/240 volt 60 Hz generators for emergency use.

Original cost to the US Government: $3467.00
Price: $600 each with Rope Starter FOB Baton Rouge, LA.
$675 each with Electric Starter FOB Baton Rouge, LA.

Weight: 275 pounds each
Dimensions: 35" Length, 24" Width, 25" Height
Fuel Consumption: Approximately 1 gallon per hour at full load

-> I also have a 1.5 KW gasoline powered 16 to 36 volt DC generator
for sale. This generator has been used to jump start 24 volt diesel
engine starters on both generators and trucks. The generator is
military surplus and is in excellent condition.

722. 4 Cylinder Engines 4 Sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-14 11:15:00 UTC
From: robert.garcia@sosinc.com
Message-ID: <2422.556.uupcb@sosinc.com>
Source record: 277781

FOUR CYLINDER AIR COOLED WISCONSIN GASOLINE POWERED ENGINE FOR SALE

I have a few rebuilt (overhauled) Wisconsin Military Spec gasoline powered four (4) cylinder engines remaining for sale. These engines were formerly used in the Army's 1200 GPM decontamination sprayers and are in excellent condition. Most engines have approximately 100 hours since a COMPLETE overhaul and rebuild.

The engines have the following specifications:

4 cylinder horizontally opposed with 84 cubic inch displacement
4 stroke OHV engine with 3" bore X 3" inch stroke
Compression ratio approximately 7.2:1 (runs on LOW octane gasoline)
Approximately 40 Horsepower at 3600 RPM
Adjustable governor presently set for 3600 RPM
Engine will work perfectly with throttle cable instead of governor
Bendix carburetor with adjustable high and low speed jets
Manual and/or solenoid operated choke
Mechanical fuel pump for drawing fuel from remote tank
Completely enclosed ignition system with Fairbanks Morse magneto
Cartridge type oil filter easily converted to "Spin On" type
Low oil pressure sensor and shutoff switch (can be bypassed)
Cooling fan built into flywheel
Built in 24 volt 40 Amp alternator with regulator and rectifiers
Electric starter available (Engine can be started with rope)
Dual exhaust, dual muffler system with crossover pipe

Need an easily fabricated top sheet metal cover for your special installation. Will run fine without this cover but components (Carb, magneto, fuel pump, oil pressure sending unit, etc.) on top are exposed.

Original cost to government > $3500 each

$250 without Electric Starter FOB Baton Rouge, LA
$300 with Electric Starter FOB Baton Rouge, LA

Possible uses are:

This air cooled engine is ideal for use in large "mudboats".
Powering Industrial Air Compressors for Painting and Sand Blasting
Powering Emergency Water Pumps for Flood Duty
Powering High Pressure Water Pumps for Industrial Cleaning Uses.
Powering Medium Size Farm and Garden Tractors
Powering 120/240 volt 60 Hz Generators for Emergency use
(Will Power up to 15 KW Generator.)

THIS ENGINE WILL POWER AN INDUSTRIAL WELDING MACHINE!

Weight: Approximately 250 pounds each
Dimensions: 32" Length, 32" Width, 27" Height

Fuel Consumption: Approximately 1.0 gallon per hour at half load
Approximately 2.2 gallon per hour at full load

Depending on your local laws (the UK has the 'Sale of Goods Act' and a few
others) a good approach is to explain to the salesman trying to sell you the
car *exactly* what you want to do, and ask him if it is likely to damage the
car (especially if you can hint that the competition is OK :-)). If he assures
you that it is OK then under UK law you have some rights if it does go wrong
because the seller obviously sold you something which was not fit for purpose.
No idea if it would work in the US though.

>True, in theory but in practice it is a little different when you are
>portable. If you refuse inspection, the FCC has no way of knowing WHICH

I don't think its any different when your portable. Your HT is your
station and you are the control operator. So if they walk up to
you, suspecting you of wrongdoing you'll surrender or lose it.

>station you actually are. In a home or mobile, it would be possible to
>track down the information via alternative means (i.e. home address, license
>plate of car) but when portable, no such means exists.

Wrong, all they need is a description of somekind. Take a 'radio print'
of your HT and compare it with the one they have on file as the
'wrongdoer'. If your not aware, every transmitter has a 'fingerprint'
that can be recorded when the carrier comes on the air. I have even
seen a card in I think CQ mag that can be bought to do the same thing.

I know this is true, because while stationed in West Berlin Germany
with the Army Security Agency, we did the same thing with a Spectrum
Analyzer and a Visirecorder to get a paper copy. Its how we tracked
different missle control stations in the field. East Block that is.

>

The ones who came in locally for the 'CBers' came in with Federal Marshalls.
I believe the FCC can only confiscated equipment. But I'm just guessing
on this one.

You might also consider rerouting the coax. You might also consider a better shielded coax. You might also consider shielding your ecm on your car with Mu metal.

Regards
Gary

It's also a great feature if you plan to use transverters for serious VHF/UHF operating. It was one of the selling points of the IC735 for me.

A. Prose Walker's idea to be exact. But it was the ARRL petition
that got the whole mess stirred up. *Now* they tell us not to
involve the FCC in matters best handled ourselves, such as self
training. Maybe they're beginning to get a clue that it's not
wise to wake the bear on issues that're likely to result in
more restrictions.

I can't say if running a ground to a cold water pipe is acceptable under the NEC,
since I don't have that book....and my CEC guide is at work.

But, under both NEC and CEC you can replace a two-prong outlet with a 3-prong
GFCI outlet. This doesn't give you a protective ground, but relies on the GFCI
to detect a fault.

You'll still need a good ground from somewhere else anyways.

I think Ben Franklin said it best when he said "Those who would trade
liberty for the promise of security deserve neither liberty nor security."
This airport thing is a small inconvenience to most of us, but it's the
little inconveniences, piled one on top of another, that finally result
in big losses of liberty. We are being whittled away from all sides
for all reasons, most innocuous sounding on the surface when considered
individually, so that we find ourselves constrained on every side.

People aren't crazier today than in the past, and terrorism isn't
new. What's changed is the instant communication that makes these
rare events seem commonplace and personally threatening. And what's
changed is that a very personal cowardice, a loss of nerve, has
enveloped the American spirit. We're no longer willing to take
responsibility for our own security. We demand others do it for
us while letting them strip us of the tools to do it ourselves.

>2. Is it reasonable to expect airport security (notoriously underpaid and
> untrained) to understand ANY radio knowledge, much less HAM radio?
> The airports have to give them simple rules to follow. Remember,
> they have to watch out for lots of other things besides radios.

If security were worth doing, it would be worth doing right. But it's
clearly not being done with seriousness. So we wind up with unnecessary
hassles and a *false* sense of security.

How do I go about determining if my FT530 is a candidate for this intermod fix,
and how do I go about getting it performed?

I was up in Calgary on holidays, and Intermod problems were pretty bad.

ZCZC AP93
QST de W1AW
Propagation Forecast Bulletin 32 ARLP032
>From Tad Cook, KT7H, Seattle, WA
August 13, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP032
ARLP032 Propagation de KT7H

Solar activity continues to be low. For six out of the seven days of our reporting period for last week the flux remained below the average for the previous 90 days. The lowest numbers were over the weekend when the flux was 91 for both days. The most disturbed periods were when the K index was five, at 0600z on August 5 and 0900z on August 6. The A index for both days was below 20.

Look for flux to slowly rise toward a peak below 110 around August 22 through 25. There is a possibility of moderate disturbances from coronal holes around August 16 and 25, and again on September 1.

There should be a modest improvement in conditions over the next month as we head toward the Fall season. A slight rise in average solar flux is forecast for the next few months, but don't expect propagation to be as good on the higher frequencies as it has been over the past few Fall seasons.

Sunspot Numbers from August 5 through 11 were 29, 49, 62, 36, 88, 82 and 92, with a mean of 62.6. 10.7 cm flux was 94.3, 94.4, 91, 91, 96.5, 101.8 and 108.3, with a mean of 96.8.

The path projection for this week is from Los Angeles, California to Thailand.

Look for 80 meter openings from 1130 to 1400z, peaking around 1230 to 1300z. 40 meters should be open from 1100 to 1500z, with best bets also around 1230 to 1300z. 30 meters should be open from 1000 to 1600z, peaking from 1200 to 1400z. 20 meters should be open from 1330 to 1700z, with the best path during the earlier part of the opening. 17 meters should have a modest opening on most days around

2300 to 0100z, and a better opening on some days from 1600 to 1730z.
Look for 15 meter openings from 2330 to 0530z. 12 and 10 meters
will not be good over most days, but check after 2300z until about 7
or 8 hours later. Also check 12 meters from 1700 to 1830z.
NNNN

736. Questions from Nonham on Portable comm

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-14 19:58:27 UTC
From: devlin@cyberspace.com
Message-ID: <24jg53$qvt@cyberspace.com>
Source record: 277857

I have a few questions about portable computer communication via radio, probably amateur.

I'm intrested in finding a way to allow communciation between a 'master' station and a portable station via radio. The minimum range needed would be one mile (at the least) and a range of more would be wonderful. The connection speed must also be 2400 baud or higher, again the more the better.

This connection would need to be very small on the mobile end, as well as battery powered. It would be used only by one person (me) who could get the proper licence(s). I would like to use it to connect with my main system from a subnotebook I plan on buying (Bicom B260i). I would also plan on connecting to other systems from my home system, via phone/modem connections. Would this violate FCC connections? (Probably..Sigh.)

Could anyone point me in the proper direction to start in (ie: packet, something else, etc)? I'm not a ham, but did a decent amount of watching an experienced ham while away at school, and still remember some of the stuff he taught me.

If this kind benefactor of information could also give me the name of books, magazines, or companies to hunt for information, I'd be grateful.

Thanks! (and 73s!)

devlin@cyberspace.com - finger for pgp public key

(Email would be great, but please post as well.. Others probably have the same questions as I do. Thanks.)

I seldom have any problem reaching KA2QJO in Watertown, NY or the repeater at Tupper Lake, NY from my apartment in Ottawa with an HTX-202 and a ribbon J-pole (disclaimer - I'm on the 11th floor of an apartment). That's in the 100+ mile range. On a good day, I can do it on low power.

I can usually get into Montreal as well, which is similar in distance.

Following a reply to an article I posted some time back, I have been inspired enough to decide that I'll got for my amateur license when I find out what I need to know to pass the necessary exams. Now that this decision has been made, I am closely scrutinising (sounds like a word that CIA or ASIO would use!) article talking about 2m HT's and MT's, but since I don't have a four-wheeled, rubber-tyred thing, MT's are out of the question for the immediate future.

Without wanting to start RAWW3 (Radio Amateur World War 3!) between supporters of each of the major manufacturers, could some people offer their comments on thr myriad of 2m and 2m/70cm HT's that are on the market (both in the US and here in Australia).

Some may have read my posts on the Alinco DJx1 wideband scanner and what I think about it. I have looked at the DJf1t 2m HT (it's built into the same case at the DJx1), and I am definitely going to try one out when I am finally able to legally try one out.

I only want genuine opinions/appraisals please. It's probably worthwhile posting followups rather than sending replies so any other prosective newcomers can read this thread as well.

Thanks in advance for your advice/help/cooperation/etc.... Craig.

have to know. Now that this decision has been made, I am now closely scrutinisin

I've been doing a fair amount of air travel lately, always with at least one HT. The variation between airports, and even between security personnel at tge same airport, is amazing. Usually, they simply ask me to "make it do something", apparently on the assumption that there can't be room in it for both a weapon/infernal machine and a radio. On occasion, I've had them ask me to take the battery off (to check to see if it's a secret compartment). Often, they simply ignore it. With the increasing popularity of hand-held cellphones, they're seeing a lot of people carrying similar-looking units. In fact, I'm often reminded not to use my "phone" in flight (a warning, by the way, that's equally valid for the HT).

If you have a problem, by the way, ask to speak to a representative of the airline. Generally, arguing with someone who is under-trained, under-paid, and is likely to be a State Trooper wannabe with just enough authority to be annoying is at best counterproductive! The airline people, on the other hand, have an interest in keeping you coming back.

Well, the one true story I have in this regard isn't about warranties, but
about the actual technical problem.

Back in 1985, I was driving my 1979 Audi 5000 on the Washington, DC area
beltway, with a friend in the front seat. The traffic was fairly light, and I
had the cruise control on.

My friend fired up his Icom 2AT, and I thought I noticed something funny with
the car's behavior, but I couldn't pinpoint it. My friend leaned a bit
forward for one reason or another, and keyed it up again, a bit longer
(talking to someone), and my car FLOORED itself, accelerating to about 75 mph
in a fairly short period.

We then tested our hypothesis that it was the hand-held, and discovered that
there were "hot spots" where a keyed-up radio would make the car speed, or
wouldn't do anything at all.

It didn't seem to do anything when the cruise control wasn't on. I can't help
but wonder how much of the "unintended acceleration" problems that people
blamed on Audis were due to some weenie with a CB and a "leenyur" amplifier,
or a cell phone, or some other RF source. As I recall, Audi never could find
a good reason for the "unintended acceleration" problem, and resorted to
putting a safely switch that required a foot on a brake when shifting into
gear from the park setting.

Of course, you're never going to see something like this until the FCC gets their new computer system installed. And of course, providing that the new system is more flexible than the old one.

Does anyone at ARRL HQ have any idea what specs have been laid down for the new system? Has an RFP been issued? Does it call for enough flexibility to be able to handle radical(or even semi-radical) changes in the license structure?

For that matter, is it possible that the software development end of it has already been awarded? If so, do we know whom it has been awarded to? Is there any way for, say, a small group of hams who are also experienced software developers to look over what is being done or planned as a third-party evaluation team?

It seems to me the amateur community has an interest in trying to ensure that what is developed is flexible enough that we won't have to put up with the old mantra of 'that would require changes to our license-processing software, which would require a substantial capital outlay, etc, etc, etc.'.

The following is a list of informational files for this newsgroup
available via anonymous FTP from ftp.cs.buffalo.edu (currently at IP
number 128.205.32.9) or the Australian mirror at grivel.une.edu.au
(currently at IP number 129.180.4.7).

Questions to bowen@cs.buffalo.edu

1750m.band - misc info on the 1750m band
222xvtr.zip - PostScript code for KH6CP no-tune 222-MHz transverter
ampr_coordinators - coordinators for packet IP addresses
antenna_refs - references for articles about antenna designs
arrl-logo.ps - ARRL logo in PostScript format
arrl_bib - bibliographies from ARRL literature (ASCII format)
arrl_digital_minutes - Minutes of the ARRL committee on digital comm.
arrl_fo_jobs - descriptions of some ARRL Field Organization jobs
arrl_info_service - announcement of the ARRLs trial information service
cal_pd_freq - California police frequencies
callbook.tar.Z - sources for the marvin callsign server v1.3
canadian.Z - Canadian ham database in FCC format
carpet.loop.2 - Antenna for apartments and small spaces
clubcalls.Z - database of US ham clubs
comb6.zip - HF Propagation Predication program
docket_91-36 - information regarding the proposed scanner regs
dxcc-k2di - ARRL DXCC country list
element_credit - rules about VE credit for earliers exams
elmers_admin - information about the elmers list (see below)
elmers_list - list of elmers on the network
exam_ops - info on exams and exam opportunities
faq_callsign - frequently asked questions about the callsign server
faq_ham_1 - frequently asked questions about ham radio (pts 1)
faq_ham_2 - frequently asked questions about ham radio (pts 2)
faq_ham_3 - frequently asked questions about ham radio (pts 3)
faq_packet - frequently asked questions about packet radio
faq_shortwave - frequently asked questions about shortwave
fft.com - EGA/VGA DOS command for spectral display (QST 1/92)
ffth.com - Hercules DOS command for spectral display (QST 1/92)
field_day_92 - field day rules for 1992
florida_antenna - Florida State antenna law info
guide2newsgroups - description of USENET newsgroups dedicated to radio
ham_sat_sum - summary of information needed to get on satellite
hams_on_usenet - list of ham operators and e-mail addresses on the net
```

hamstacks - information about the question pool stacks
handicap_waiver - info on obtaining a handicapped test waiver
hf_rigs - QST reviews of available HF rigs
ht_info - general information about commercial hand helds
icom_ic_w21at_mods - increases the number of bands on an Icom IC W21AT
intro_to_swl - info for aspiring short wave listeners
intro_to_scanners - info for aspiring scanner listeners
jlem.zip - Program, w/source, for 2kx8 ROM emulator, QEX 01/93
j-poles - description of j-pole antenna made from twin-lead
lead_acid_batteries - essay on lead-acid batteries
license_plates - guide to ham calls on license plates
logos - PostScript logos for various ham organizations
mail_order - a database of electronic mail order shops
manufacturers - names and addresses of ham gear manufacturers
motorola_ge_service_man - how to get service manuals for Motorola and GE rigs
nasa_select - places where you can hear NASA SELECT broadcasts
new_packeteers - helpful essays for new packeteers
newcomers - tips and hints for those new to amateur radio
nprm_93_85_text - text of docket 93-85 (message forwarding systems)
packet_clubs - organizations you can get more packet info from
packet_gateways - list of gateways from packet to Internet
packet_misc - miscellaneous packet info
packet_software - list of packet software versions
phone_bbs_list - phone BBSs for ham related issues/software
pio_handbook - ARRL Public Information Officer's Handbook
pr_docket_92-136 - text of FCC PR Docket 92-136
qsl_bureau1 - information about the ARRL QSL bureau
qsl_bureau2 - "what should I do if" list for the QSL bureau
qst_prodrev - index of ARRL product reviews in QST
quest_pool_novice - novice question pool - good after 7/1/93
quest_pool_technician - technician question pool - good after 7/1/93
quest_pool_general - general question pool - good before 6/30/94
quest_pool_advanced - advanced question pool - good before 6/30/95
quest_pool_extra - extra question pool - good before 6/30/96
repeater_map_proj - description of Electronic Repeater Mapping Project
rfi_tips - good posting about RFI
sol_geo_data - desciption of daily solar geophysical broadcasts
sol_terra_terms - glossary of solar-terrestrial terms
sstv_wefax_info - general help for SSTV and WEFAX users
usenet_purchases - tips on buying and selling via USENET

For readers of this newsgroup both new and experienced, these files are a de-facto "Required Reading List" to provide definitive answers and pointers to other sources for questions that come up in this forum.

This is also your archive, so any additional articles, guides, or small PostScript graphics that you feel would enhance this collection are most welcome. Submit to Devon via his E-mail address above.

Thanks go to Devon Bowen, KA2NRC, for providing diskspace and maintaining these valuable archives, as well as all the authors who wrote and submitted

the information contained in them.

Additional archives out there that have /pub/ham-radio directories are encouraged to "mirror" these files to provide redundant storage for these documents. Some of these sites (which may or may not mirror ftp.cs.buffalo.edu) include:

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July weekly
August bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Packet technology will do what you want. The only real question is
one of legal technicality. As long as you aren't using the system
for routine business communications, or dealing with obscene materials,
you could use amateur radio. However, if you intend either of the
above, or communications with non-hams (sometimes legal, sometimes
not, a complex issue), then you'd be better served by a commercial
license.

Pac-Comm, 3652 W. Cypress St, Tampa FL, offers packet equipment
for the amateur and commercial markets that is small, low power,
capable of baudrates up to 9600, and in some commercial models also
includes the two way radio as well as the digital equipment in one
integrated box. AEA and Kantronics also market items for the commercial
market, but their equipment is larger, uses more power, and isn't
integrated with a two way radio.

A note on packet speed. Normal amateur packet, and most commercial
varients, is half duplex on a simplex radio channel. That means
that a 1200 baud connection will behave like a much slower telephone
connection of the same basic baudrate. Because of turnaround delays,
effective thruput will be quite a bit less than 600 baud for single
hops. If you need a relay point, called a digipeater or node, then
the effective thruput is at least halved again for each such hop.

AX25 packet allows up to 8 hops, so it's possible to see thruput lower than 40 baud on a *clear* channel. If others are operating on the channel as well, it will be even lower as the channel is shared. 2400 baud is not remarkably better because turnaround delays and short packets slow it nearly as much as 1200 baud.

9600 baud is better. Sometimes the thruput equals a phone 2400 baud modem, even on a fairly busy channel. To get the snappy interactive response most of us are accustomed to, however, you need to jump to 56 kilobaud RF modem systems. GRAPES offers a *kit* for amateur use at this speed. Using an interactive text editor on a system two hops away is very workable with this system. Simplex range is usually in the 10 to 30 mile area depending on terrain.

It should be noted that when you step above 1200 baud in the amateur bands, however, it's sometimes difficult to find other stations who can accomodate your higher speed transmissions. 2400 baud is pretty much a dead issue on the amateur bands, but 9600 is building a larger following. The GRAPES systems total perhaps 700 or so worldwide, so it's definitely a good idea to pair up with a partner if you want to operate at this speed right now. (There are a few "hotbed" areas, such as the Atlanta area, some places in Canada and Europe, and a few spots in SE Asia where 56 kb is fairly common.)

In the commercial world the only equivalent is the spread spectrum wireless lan product. These latter, however, may not have the range you need. Achieving a one mile range with the wireless lan products usually requires ideal terrain and point to point directional antennas. The other systems can be used with simple whip antennas, and more power, so that you can range about mobile up to 30 miles from a base station under most terrain conditions. And you can use the node relay mode to use other, often high site mounted, relay stations to extend your range to 60 miles or more. Use of more than two relay nodes for real time communications is usually not feasible. If you need longer distances, you have to resort to store and forward systems, mainly Email type operation.

746. Opinions: TM-241A, DR-130T, ...?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-15 14:19:43 UTC
From: spf@cbnewsl.cb.att.com
Message-ID: <CBt14x.CL8@cbnewsl.cb.att.com>
Source record: 277873

Hey folks,
I've been interested in an entry-level 2m mobile on the cheap,
but have found them rather tough to come by used (I don't get
the time to hit fests and such, unfortunately). So thumbing
through ads and looking at prices, I find a few "name brand"
models in the $300s. Two of these, the Kenwood TM-241A ($380)
and the Alinco DR-130T ($330) stuck out for some reason, though
I'm sure there are others in their category.

I'd appreciate any opinions on these rigs, since in my frustration
I'm likely to do something rash. I don't think I need dual band
(and I'm pretty sure I can't afford it). I just want a basic
mobile with good power, dtmf, and extended receive (to satisfy the
voyeur in me). Any thoughts?

>How do I go about determining if my FT530 is a candidate for this intermod fix,
>and how do I go about getting it performed?

I've posted this answer on this thread already. I suppose it's easier to ask again than to do a little research though...

If the box your radio came in has a little orange dot sticker on it, then it's been reworked. Another way to tell is by what antenna your radio came with. If you've got the little fat stubby duck, then it's the pre-rework version, if you've got a duck with a load on the bottom and a thin upper section, then it's the reworked unit.

> In article <1993Aug9.142049.21718@walter.cray.com>, Walter Spector writes:
>
>> >
>> >: My new(?) house is 38 years old and has (mostly) two prong (no ground)
>> >: AC-outlets.
>> >
>>

The house where I rent has mostly two-prong, but the wiring is all covered in the flexible, metalic conduit (I think the common trade name is BX.) An electrician friend that used to live in the area told me that since the BX was connected to ground at the service panel, and was electro-mechanically connected to each outlet box, that the outlet boxes provided a suitable ground. Don't accept my word on it, I'm sure your insurance company won't :-)

This brings up another point that perhaps somebody else will have clarification on. My water is from a well, with the pump and tank situated in the basement. However, the feed line to the well is some sort of plastic, that looks like PVC. Since I have never seen PVC that conducts, my assumption is that _my cold water pipes are _not_ grounded_. If anybody knows anything to the contrary, could you 'splain thees to mee pleeze. Otherwise, well water users beware!

SB DX @ ALLBBS $OPDX.123
Ohio/Penn DX Bulletin No. 123

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 123
BID: $OPDX.123
August 16, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF8WS, OH2BUA, PW8JP, W4/YV5DTA, AD1C, K4CEF & Southeastern Cluster Group, WA2UDT, N4VZ, KK6H, K8JP, KF8VW and K8YSE for the following DX information.

4W, YEMEN. Paul, KK6H, informs OPDX that Otto, UA4WAE, indicated that the Republic of Yemen will not issue a license or operating permission to a DXpedition group which includes American operators. Also, during the last several weeks, the U.S. Department of States has issued a series of "Traveler's Advisories" warning of potential hazards to American citizens traveling in the region. Therefore, American involvement in the planned October DXpedition, including the support of ICOM America and Force 12 Antennas and Systems, has been suspended indefinitely. No further plans for American participation can be made until these problems are resolved and all necessary documention is received.

5A0RR CARDS AND ROMEO 3W3RR/AH0M. 5A0RR cards are being received by many. Word has it that Romeo is in Moscow and will be admitted to a hospital some time next week. There was no specific word on the reason for his admittance, but "RUMORS" indicate it has something to do with his trip to Libya. Statements are being made that there will be no problem with the 5A0RR documentation and Ed, NT2X, has all the details and will make them public soon.

9M0S CARDS. It was reported on one of the DX nets that all the labels were printed and will be sent to W4FRU for processing. Cards should be out in two weeks.

BV9P, PRATAS ISLANDS. The latest word on this operation is that it has been delayed again until around October 6-8. The group has decided not to rely on the official flights to the island, but will hire their own plane.

EP, IRAN. EX0A, EX0M, EX0O and EX0Y have received their licences from the Iranian embassy in Bishkek. They will be active from October 1st to November 1st. They will try to be active on all HF bands, but to be active on the WARC bands another transceiver is needed. The group is hoping to find someone to sponsor them. Their calls for this DXpedition will be EX0A/EP, EX0M/EP and 9D8UM. All QSLs for this operation will go to DF8WS.

KP2, VIRGIN ISLANDS (U.S.). Bill, WA2UDT, will be active from St. Croix (NA-106) from August 22 to September 7 operating as WA2UDT/KP2. He will concentrate on the WARC bands both SSB and CW.

OH0, ALAND ISLANDS (IOTA EU-002). The club station of OH2EW will sign OH2EW/OH0 from September 24-26. Operators Jyrki/OH2BAP, Jorma/OH2BEJ, Kari/OH2BMY, Jukka/OH2BUA, Ilpo/OH2KM, Pertti/OH2KIF, Pena/OH2NGS and Eljas/OH2ZA will operate mainly for participating in the Scandinavian Activity Contest. They plan to be active on all conventional 80-10 meters bands (from one station) and SSB only. The station will be equipped with an amp, beams for the higher bands and wires for the lower bands. QSL via CBA.

SV/A, MOUNT ATHOS. It has been reported that JA3MNP will be active from here beginning August 20th and will be assisted by SV2WT. There are no other details at this time.

VS6WV AND THE 41ST ANNUAL W9DXCC CONVENTION. Are you ready to hear yourself at the end of a DX pile? John, K9EL, has arranged a DX QSO Party with VS6WV on August 28th from 1130-1230z on approx. 14010 kHz with his center listening frequency on 14040 kHz (listening up and down). Rain date will be August 29th. VS6WV will record it all and edit the tape to be played at the W9DXCC Convention.
The W9DXCC Convention will be held on September 11th at the Glen Ellyn Holiday Inn, 1250 Roosevelt Rd, Glen Ellyn. Il 60137 (a western suburb of Chicago). The whole day will be filled with many activites, such as: presentations on the 1993 Kingman/Palmyra DXpedition and the AH1A DXpedition. Many other forums will be conducted throughout the day. The Dinner Banquet speaker will be Bill Kennamer, K5FUV, from the DXCC Desk. For more details, contact Dick Nord, K(AB, 2417 Maple Ave, Northbrook, IL 60062.

XV, VIETNAM. XV7TH was active this past weekend (Aug. 14-15) on 14195 kHz at 1430z and 21295 kHz at 1515z. QSL via SK7AX.

ZS0PI, PENGUIN ISLAND (Update). An operator from the German group who was active from here stated they experienced extremely poor propagation from Penguin Island to North America. They made 10,000 QSO's, but only 200 were with North American stations.

ZZ8SA, SAN ANTONIO ISLAND. PW8ACE, PW8AFL, PW8EM, PW8NG, PW8PA and PW8TR will be active from 0000z August 21st to 2400z August 22nd. Contacts will be valid for the Brazilian Islands Award. Operations will begin on the Brazilian DX Net (21223 kHz), but the following frequencies will be used: CW - 3515, 7015, 14015, 21015 and 28015 kHz and SSB - 3780, 7080, 14260,

21260 and 28460 kHz. QSL via PW8NG, Miguel Roumi, PO Box 84, 780900-970 Porto Velho - RO, Brazil.

WRONG AND NEW ADDRESS. Nick, 6O/G3KOX, who is now back in England reports that his callbook address is wrong. The correct address for G3KOX is: Nicholas J. Waite, 7 Lanercost Close, Welwyn Herts, England. Cards sent to the old address are picked up every few months and most do not get lost, but if you don't get your cards in a few months, try the new address..... Steve, W4/YV5DTA, wants to inform OPDX readers that for people who need QSLs from his last operation from "La Tortuga Island (SA-044)" to use his new address. QSL to Esteban Morao, 850 E. Comm Blvd. # 131, Fort Lauderdale, Fl 33334. Steve also mentioned he can help in retrieving QSL cards for YV5ARV..... For those still waiting on YX0AI QSL cards, a new address has emerged with a turn around in as little as two weeks. This is an address in Miami. QSLs are gathered and sent via an air cargo plane where the cards are collected at the other end and then sent to the QSL Manager by courier rather than through the mail. The adress is: Mike Manafo, ECA SAM 314, Jet Cargo International, Box 020010 Miami FL 33102-0010....

PREFIX CHANGE. There has been a report that the New Brunswick stations will be converting to the VE9 prefix in 1994. They will have the first 3 months of 1994 to change from VE1 to VE9. The VE9 prefix used to be the prefix given to experimental stations.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Howdy!!!!!!!!
I just wanna ask for opinions on handheld units...
I'm new to this, and have an incredibly limited budget
as in, at most, say $150-200. So, I want to find a decent,
most likely used 2m handheld. But I don't know much about
the name-brands.
I'd like to hear your opinions on units you have USED that
might fit my budget limits. Please don't send me messages
saying some namebrand really stinks if you can't tell me why.
Anyway, thanks in advance!

Please email me at: FSRLA@ACAD3.ALASKA.EDU

In a previous article, spf@cbnewsl.cb.att.com (Steve Frysinger of Blue Feather Farm) says:

>and the Alinco DR-130T ($330) stuck out for some reason, though

I have an alinco DR-130, and its great.. As for extended recieve, i think
that would have a lot more to do with teh antenna, no? I purchased the
radio after i got a 5/8th wave Midland Mag mount, and I've made a few
out of s of state contacts recently as the band opened up at night. My opinion
on the radio is that its great! I love it, but if you've kept up with the
postings you'd see that i have found one flaw, and not resolved it yet.
(Since it is finnaly monday, i do plan to call Alinco)..

I can't place the radio in simplex mode, without setting the offset to
00.. This can be really tricky going down the highway ;)

Or more precisely, "more area repeaters, Maynard, MA"

There are also repeaters in:

Billerica 147.120
Stoneham 146.715
Marlboro 146.610

Which should be reachable from Maynard. Of these three,
Billerica is the most active that I know of.

You should also be in range for some of the southern New
Hampshire repeaters. I know there's one in Nashua, NH but
don't know the frequency.

Enjoy your trip and say "Hi".

Scotti

Message-ID: <wb9omc.745513573@dynamo.ecn.purdue.edu>
Source record: 277799

I'd like a couple QSL adresses please, preferably from a 1993 international callbook. These need to be fairly recent ones.....

PV8AAL.....I think he said page 1293 in the 93 Int. callbook.

4N7ZZ......don't have an address for him and he may have moved with all the mess over there these days.

Your assistance wouild be appreciated.

>word on it, I'm sure your insurance company won't :-)

The NEC permits armored cable to serve as the protective ground conductor (all outlet boxes are required to be metal with BX cable). The CEC, and good sense, forbids using the cable armor as a grounding conductor, because both more error prone and more subject to mechanical failure than an actual wire. If you plan to change 2-prong to 3-prong outlets relying on armored cable for the grounding conductor, use an ohmmeter (and some long wires :-) to make certain that the conductor is continuous all the way back to the junction box.

>users beware!

The house I am about to purchase also has well water. I don't know if the well supply pipe is PVC or metal, but there is an explicit ground wire for the cold-water lines (which doesn't go to the service-entrance ground post, which I think is an error). You may want to look around and see if you've got a grounding wire attached to the pipes (or use an ohmmeter), and if not, add one.

Since ownership of an HT without a license is legal, then there is no
justification of "probable cause."
It is in violation of no FCC
law to have such equipment at home or on one's belt (an HT).

> Childish games are rarely of much value when dealing with
>law enforcement personnel.

But neither is rolling over and playing dead or having one's rights
trampled by law enforcement personnel. I do not just "ID" myself to anyone
because they want it.

>can be assumed it's a reasonable hour, and they can demand to inspect
>your equipment and your license documents.

True to a point, but since ownership/possession of an HT is perfectly
legal for anyone, licensed or not, then I'd think the FCC would
have to have ALSO observed someone operating before having sufficient
probable cause to just stop someone and ask them for their ham license.

>Since our station and
>operator licenses are printed on the same piece of paper, it would
>be difficult for them not to see if you had the proper operator
>priviledges for the station you are carrying.

As a novice, I had equipment that could operate in bands that I
was not "privaledged" to operate in. The issue is not the
equipment, it is: Has actual unauthorized/illegal transmission
occurred?

> Failure to have the
>station license documents present at the station location is also
>a violation.

Given that the FCC recently stopped issuing station license details
(the space is left blank on all new licenses), I suspect that isn't
the case anymore. Regardless, none of us that operate mobile/portable
actually have a station license for such mobile/portable situations anyway.

>So the short answer is that they could suspend *any* and *all*
>licenses you may hold if they find you without the proper documents,
>or if you refuse inspection.

ONLY if you are actually transmitting.

Well, that's hardly true OR fair, Gary. As you very well
know, 'they', meaning the folks at ARRL, are unusually clear on
the whys and wherefores of not waking the bear.

The problem they face, actually, is making it clear to
the rest of the folks that we have adequate staff at ARRL HQ
to assist with rules interpretations -- in fact a whole branch of
people.

"Beginning to get a clue?" Nah... that happened a long time
ago.

Message-ID: <1993Aug16.154339.9674@ncsu.edu>
Source record: 277796

With my first DX contact yesterday, I am all excited about getting
a map of the world to stick pins in, marking all of my contacts.
It's a great way to show off to your friends which states and countries
you have worked.

Has anyone tried this using a CAD package or a drawing package instead?
I thought it would be nice to print out a copy and hang it in my
office. I could use different colors for different modes or bands.
Some CAD programs have "layers", which allow you to distinguish
different properties (again, for modes or bands). I figure that
using a CAD program makes it easier to make copies of my map, makes
it easier to transport, but makes it harder to print a wall-sized
map. Any ideas? Anyone have an AutoCAD-ready plot of the world?

Source record: 277789

Hi Guys

Owner of a NRD-535, I write a software for this receiver. I would like
to know the RS232 commands of other JRC receivers, notably the NRD-525
and the JST-135 tranceiver. (or even the new JST to come) I suppose the
commands will be similar, so adding support for these to my program
should not be a great deal? If someone would mail / fax / email me the
manual pages for the RS232 interface of these RX's, I would be very glad.
(How to get a copy of my software... ;-)

Thanks a lot, Andreas

''''''

764. software for JRC NRD-535 available!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-16 16:09:33 UTC
From: meister@lsncsc.enet.dec.com
Message-ID: <9308161509.AA07998@vbormc.vbo.dec.com>
Source record: 277791

Hi Guys

I'm currently in the final phase of the v1.0 of a software to control the JRC NRD-535 receiver. This software has several features which (I hope) you may find usefull.

1. The whole thing is built on a graphical interface, so you can activate all this stuff with mouse clicks, motions and double-clicks, whereas most functions also can be accessed from the keyboard.
The user interface is some 'PseudoWindows' but very pseudo...

2. One window is to control all possible receiver functions from the computer, owners of the NRD535 know which one cannot be con-trolled via RS232.
This window is not very usefull, controlling the receiver manually is much more conveinent.

3. Two more windows are for the managing of the 200 memory cannels. You may edit every channel individually (define, delete, change, etc.) and you may overlook these definitions in another window. Usefull is the fact that you can save the 200 memory channels in a diskfile, so you always can keep as much memory definitions as you want, in files of 200 channels.
Channels are directly tuneable, and receiver settings may be dumped directly in a channel.

4. Exciting is the bandscan feature: You may draw a graph of the occupation of a band and then you may click in the graph, e.g. on a peek representing a transmitter, and the receiver will be tuned directly to this transmission. Mouse dragging is also allowed.
These scan graphs may be saved in a file for later reloading, a previously interrupted and saved scan may be reloaded and resumed.
The scanning can be most flexibly parametrized, and you may customize the thing to be able to select the most used and preferred band with just a mouseclick.

5. There is also window that allows you to do some unattended recording: the 535 has a timer relay on the back, which will be switched on at predefined times (8 / 24 hours) while the receiver will be tuned to a seleced memory channel.
For long waiting periods (0 to 59 minutes) the receiver is switched off to save its lifetime and your A/C current.

6. A database exists to hold either a database with programs
from a schedule or your 'would like to catch it' stations.
in a line oriented display, you can click, scroll, etc
around these entries, tuning the receiver directly to a
selected entry.
I would like to provide somewhen a kind of database compiler,
to facilitate the data entry...
the databse can be browsed following user defined search
criteria, and you may have a unlimited number of databases,
open one at a time.

7. The logbook is almost the same as the database, except that
the fields in the database entry differ slightly to reflect
their use.
you can have either the databse or the logbook open, but not
both at a time.

8. Browsing in the databases, you are able to print the found
records, to load them directly to the receivers memory channels
(starting where you want) and/or to load them in a file
for later reloading to the receiver memory.

9. Colors may explicitly be customized, while the used preferred
settings are saved for the next invocation of the program.

10.I develop this sftware on a IBM comatible 286 (verrrry old)
and a VGA 640*480 screen.
So this is the hardware requirement, I suppose most of you
will have better.

Now, I look for people willing to have a look at it for testing, maybe
using? I would be very interessted in your comments, bugs found, etc.

Also, I would like to know the RS232 commands of other JRC receivers,
notably the NRD-525 and the JST-135 tranceiver. I suppose the commands
will be similar, so adding support for other NRD's should not be a
great deal? If someone would mail / fax / email me the manual pages
for the RS232 interface of these RX's, I would be very glad.

How to get the software?

best is to send me a mail to 'meister@leman.enet.dec.com' and I will
register you as a test user or whatever you will be. Since I work at
digital, I cannot provide direct ftp access but I will mail out a
uuencoded zip file. I still have to write the documentation, altought
it is partly written. So I will not be able to send out the stuff this
week. And even bader, not even this month. Look, I'm swiss. Swiss men
need to join every year for 3 weeks the army. That's bad. And that what
happens to me from 23 sep to 11 aug. So don't mind sending your requests,
but don't get impatient if no answer arrives before week 37.
The software is free, for testers anyway, and one day, If it works per-
fectly, I maybe want to charge a small fee, but most important for the
moment is your feedback.

My home address is : Andreas Meister
ch. des Brits 2
1040 Echallens
SWITZERLAND

Fax (business) is: 0041 21 6915344 (please specify my name)

and email address: meister@leman.enet.dec.com

Cheers, Andreas

PS: non NRD-owners are (of course) also invited to ask for the software

765. Serious RTTY: AEA 2232 or Grace any good??

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-16 16:46:31 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <24odl7$7u5@news.acns.nwu.edu>
Source record: 277795

I am interested in weak signal RTTY DX. I have a few questions:
How good are AEA2232 and Grace DSP12?
How do they compare with HAL and Tono modems?
What software is good for RTTY operations?
How would PK232 optimized for RTTY and a W9GR DSP filter compare to above?

The areas in which one could compare would be:
front end filter
slicer and demod
tuning aids

I will use FSK for output so I am not worried about audio out stages.

Any pointers in setting up a serious RTTY station will be appreciated.

Rajiv

I currently use a FT-1000 and HAL ST-8000. The 8000 is greatly
superior to a PK-232 which I used to use. I had installed AEA's
four resistor mod to the 232 - helped a touch, but not all that
much. I don't see how one could do serious RTTY work without a
scope for tuning. The Tonos are well respected by RTTY DXers
also. The multipath detection modes (one each AM and FM) on
the 8000 will read some badly distorted (eg, polar flutter)
signals that nothing else seems to. The AM modes on the 8000
are superior to the FM mode only rarely.

The SK should ONLY be used at the end of your final
transmission to another station.

And unlike the silly ARRL code tests. SK (or AR for that matter) goes
before your last identification.

-Ron

But **WHY**, Ron, **WHY**???????????

People keep asserting this, and no one YET has told me WHY
"W1MX DE KG2S SK"
is incorrect, and WHY it should go before the callsigns.
I am willing to conform, if those who assert can just
come up with a good reason.

Does ANYONE at ALL know the reason? Or it totally random?

(Anyway, even The Book disagrees with you, Ron, about AR, which
is properly placed at the very end.)

: internet:chinatti@phoenix.Princeton.EDU bitnet:chinatti@pucc.bitnet

You could use a micro processor to detect the tones. I succesfully built a
12 tone decoder 5 tones sequence with a simple 68705G2 micro.
Very low component count etc. only programming needed.

The algorithme is as follows:
for a certain tone you store the period time. When signal comes in
measure periode duration with the timer. You can also store the
number of periods you want to be able to check the right tone duration.
For a less then ideal signal to noise generation the following helps.
The period you measure can have a variance depending on the noise level.
This gives a litle off-set to the possible values and makes you able to
discriminate between a wanted signal and another signal. Because of the
fact that the sum of a certain amount of periods must equal a value with
a tolorance for a certain bandwidth, a succesful detection is possible
with a not ideal s/n ratio. The ratio which the algorithme can cope
varies with the number of periods of the wanted freq as well as the
wanted false alarm rate.

Succes,

Robert, PA2JOB.

I would be interested in hearing from anybody who has (un)successfully performed the hardware mods on an FT470.

From: wroth@sun198h.kodak.COM
Message-ID: <6640@eastman.UUCP>
Source record: 277763

I just ordered a Kenwood TS-50S mobile transciever, and I wondered if anyone has
bought one, and how they like it. How is the noise blanker for drowning out ignition
noise? What needs to be added for RS-232 control? Is it as simple as adding 2 IC's
as with the TS-440S?

Thanks in advance. 73's from Wayne, WA2N

Benjamin Franklin once wrote something like, "Those who would trade liberty
for temporary safety deserves neither liberty nor safety."

Minor compromises in one's rights (in this case, unreasonable search) inevitably
leads to others. Government is not there for the benefit of the governed; it
will try to grab power from anywhere it can and keep it.

"Trivial" freedoms are a contradiction in terms. We do know of a way to have
a totally law abiding society. The New York Times wrote about it on 8/16/93.
The Soviet Union was VERY law abiding while it was a totalitarian state.

No matter what the "trivial" restrictions are asked for, it will not be enough
to stop crime so more "trivial" restrictions will be demanded.

I have GOT to get this QSL from Cuba. Last night, I worked CO7JC in Camaguey, Cuba, and he said that direct address (even gave PO Box) was the best way to go.

Do Cuban hams expect return postage to be included? Obviously, sending dollar bills to Cuba is probably NOT a good idea, given the climate of hostility between the US and Cuba.

So does one expect that a Cuban will pick up postage, or should I include an I.R.C.?

Anyone have a Cuban stamp?

[Advance apology for quoting the whole thing...]
```

"Kaybec" is the French pronunciation of "Quebec". You should take a couple of years of French, like I did in high school. After you get into the habit of pronouncing obviously French words in the "correct" fashion, it is really hard to break that habit (and maybe, with increasing globalization, it is a good habit to have in the first place...). It occaisionally gets me some really strange looks. "Baton Rouge" is a good one for that, with the nasal "on" and the guttural "R".

Steve,
If you don't mind spending a bit of money, contact Bramco, Inc. at 513-773-6255; they manufacture tone signalling encoders and decoders. They have a 1+1 (oops, Trademarked) tone decoder (1+1 = Motorola's Quik-Call II [Trademarked]); their price is $215 (1989 catalog). A cheaper route would be to just purchase the tone reeds; their catalog says "RF-30 For use in Minitor [TM] and Pagecom [TM] pagers by Motorola": $16 each.
I've used their reeds to decode the OLD Motorola 2+2 Quik-Call format: two simultaneous tones followed by two other simultaneous tones (as used by many large fire departments).
Note that Motorola insists on spelling Quick as Quik....

When I spent some time in Vancouver,BC I learned that they seem to pronounce
the province name as KE-BECK while the capital city name is KAY-BECK. But
what do West Coasters know about French?
Try pronouncing Louisville, as in Kentucky, the way the locals do it.
My home state here is more properly pronounced ORI-GUN than ORY-GUN, though
its maybe somewhere in between. Don't ask me, I grew up here. When I visited
Oregon, Ohio, I was shocked to learn they pronounce their city R-EH-GONE.

Neither callsign is considered part of the "transmission."
You send SK to let the receiving operator know s/he can
stop typing, then send the calls.

But if you're just ragchewing, who cares?

Uncle Fidel just (couple of weeks ago) made the US dollar legal tender in
Cuba. Seems the country needs the support of emigrants sending money
back home to family. Hence he has made it legal and encourages it. SO I
imagine there is no problem sending CO7JC a couple of greenbacks. Might
even help keep him on the air.

783. 'Diversity Operation'?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-17 01:55:47 UTC
From: mwandel@bnr.ca
Message-ID: <1993Aug17.015547.26921@bnr.ca>

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

This may be a FAQ, and yes, I am one who unsubscribes to these groups when nothing interesting passes by for a while so I may have missed it in the past. I am wondering about 'Diversity operation'. My shortwave receiver has an allusion to it in the manual; it involves tying the final IF of two receivers together and tuning them both to the same station. My guess is that two physically separated antennas are involved and the intended benefit is to reduce selective carrier fading. It takes a leap of faith not to imagine phase flutter as the two IFs get close to each other in frequency though. And why not just sum the two antenna outputs at the RF level and only use one receiver?

Simplistically I once heard a catchy synthesizer pop piece on the German station and set one receiver (the big old one) to 6100 and my DX440 to 6075, on both of which the station transmits, and found that the selective carrier fading was not in sync and the overall music listening experience improved. In fact, the wafting back-and-forth effect combined with the electronic music was very neat indeed.

Today I was listening to the same frequency on both, using wire antennas less than one meter apart and found that the selective carrier fading was not exactly the same on both machines. Is this what 'diversity' exploits?

Anyone care to reminisce about practical use of this technique? Is it still used or has it been obsoleted by SSB?

I just read in the newspaper (yesterday, I think) that Cuba now allows its
citizens to hold foreign currency, including dollars. Given their
financial problems right now, I suspect that dollars would be welcome.

Is that anything like the security officier that throughly hand inspected my carry-on baggage....and then swept me carefully with the wand metal detector.... including a couple of passes over my bare arms....and the bare arms and legs of the passenger next to me.

I'm sure somebody might try to conceal a gun on a bare arm.....esepecially on somebody that resembles a toothpick (like me 8-).

The possibility of me moving to the US might be lurking in the future....

I'm wondering what happens when I move to my Amateur Licence.

What does each of the Canadian License classes become under the US Licensing system?

Basic ->
Basic+5WPM ->
Basic+12WPM ->
Advanced ->
Advanced+5WPM ->
Advanced+12WPM ->

Could you add what the US classes offer to, I've forgotten what they are.

> The areas in which one could compare would be:
> front end filter
> slicer and demod
> tuning aids

The AEA DSP2232 has a 171 tap FIR filter in the front end. It is a
symmetric linear phase FIR filter. It has extremely steep skirts and
a fantastic shape factor. The passband of the filter (distance between
cutoff in the design) was determined by shift+modulation+mistuning
allowance. The slicer/demod is determined by computed output SNR. It is a
two two-pole IIR filters, one centered at each tone pair with the 3 dB points
determined by the geometric mean of the frequencies. This means they have
different Q's but this IS proper design. The output of each of these filters
is full-wave rectified (take the absolute value) and one subtracted from the
other and then low pass filtered with a filter whose cutoff is 25% above
the Nyquist rate for the symbol and whose stopband (first zero in its
response) is at the symbol rate. This gives you 25% excess bandwidth
and is more than adequate for HF work given the huge amount of oversampling
being done (it is not synchronous so no clock needs to be recovered but
it is still a reasonable design principle). In parallel to this is run
what I think is the best demod. I make an analytic version of the signal
(bandpass filter with the above filter and take a Hilbert transform filter
with exactly the same design parameters, group delay, etc.) and run a
complex signal PLL. When you do the phase detector on this signal THERE
IS NO RIPPLE COMING OUT OF THE MIXER DUE TO THE SUM TERMS BECAUSE IT IS
COMPLEX. The PLL parameters are determined by desired signal (shift, bit
rate, etc.). The old tired hack of PLL's are inferior to Filter slicer
modems is due to a million analog engineers who tried non-theoretical
PLL's. There is no comparison in this approach and say (Heaven help us),
the Exar 2211. However, just to be fair about it. I did the best job
I could do on each and then ran a statistic of my own design to determine
which was producing the highest output SNR and this determined which
actual demod was used to send data to the 8530 (serial interface chip).

The real drawback to the AEA and Grace box is that there is no provision
for scope output IN THE CURRENT SOFTWARE. For the serious RTTY'er it

would be a real benefit for the AEA folks to use the second radio port
for a scope output of some variety. This would have to be eye patterns
only. There would be no method available for output of the individual
tone filters so that you could get a `cross pattern' for tuning since this
would require TWO D/A'S in addition to the one making AFSK. This could
be done for the serious RTTY'er special modem for the DSP2232 which demanded
that you use the FSK outputs to drive the transmitter, and then used both
D/A's (one per radio side) to drive the X and Y inputs on your scope.

The PK-232 is a comprimise. It is 200 Hz shift for packet use and this
is also used for 170 Hz RTTY. THE DSP boxes do digital synthesis of the
tones required for AFSK. I assume that most of the other non-DSP multimodes
also used this approach but I do not know for sure.

I have no current information on the AEA development efforts and don't
even know what is in the current box since I have not worked on the
project since last year when we ended our relationship.

ZCZC AP92
QST de W1AW
Propagation Forecast Bulletin 31 ARLP031
>From Tad Cook, KT7H
Seattle, WA August 6, 1993
To all radio amateurs

SB PROP ARL ARLP031
ARLP031 Propagation de KT7H

Solar activity continued at low levels last week. Solar flux was about eight points lower than the average for the previous 90 days. The only disturbed periods were when the K index reached four on July 29, and again on August 4, followed by a K index of five on at 0600z on August 5. This last disturbance is from a coronal hole on the northern part of the Sun, and is expected to cause more upset on the day that this bulletin is released.

Last week's bulletin said that we would probably see a new solar flux low near 80 around August 9. The latest data shows that the short term low should only go to around 85, and occur about nine days later. The flux should then pass above 100 again around August 27. Possible disturbed days are August 17 and 25.

Sunspot Numbers from July 29 through August 4 were 72, 51, 66, 73, 70, 40 and 41, with a mean of 59. 10.7 cm flux was 100.4, 97.9, 96.2, 100, 100.7, 97.9 and 96.1, with a mean of 98.5.

The solar cycle graph program from WA4TTK mentioned last week is available for download from the ARRL BBS at 203-666-0578. Check File Area Two (IBM Programs) for SOL24-1.ZIP. It is also available by mail from the author. Send a formatted 3.5 inch or 5.25 inch diskette, high or low density, to Scott Craig, 409 Jessie Drive, Nashville, TN 37211. Be sure to include a stamped addressed return mailer, and don't forget to format the disk.

This week's path projection is from Cleveland, Ohio to Australia. 80 meters should be open from 0830 to 1130z, peaking around 1000z. 40 meters should be open from 0730 to 1230z, with the best period from 0900 to 1100z. 30 meters should have propagation from 0700 to

1330z, with the best conditions from 0800 to 1130z. At about 10,000 miles, this path is a long one, and conditions above 10 MHz are not promising. 20 meters should be open most days from 0600 to 0730z, and from 1130 to 1300z. 17 meters has possibilities from 0400 to 0530z. 10, 12 and 15 meters do not look good at this time.

Can I legally access a telephone and then dial out from there while on the
packet radio? Isin't that considered retransmission?

From what I've learned from Gary's post and others, Packet seems the way I
want to go. Now, two more questions:

1) Are there any magazines that are a good source of packet info?

2) How much is this going to cost me? Say, for example, I wanted to put in
a 9600 (or even 57.6) capable station w/ antenna, the material necessary
for the mobile station, etc.. Can anyone suggest what an area for costs
will be? I'm a HS student, and can't really afford to drop an incredible
amount of money in a station.. (Sigh).

Thanks!

Uncle Fidel just (couple of weeks ago) made the US dollar legal tender in
Cuba. Seems the country needs the support of emigrants sending money
back home to family. Hence he has made it legal and encourages it. SO I
imagine there is no problem sending CO7JC a couple of greenbacks. Might
even help keep him on the air.

That embargo is still on. It's a good idea to check with the U.S.
Government (Treasury, is it?) to make sure this would be legal.

Neither callsign is considered part of the "transmission."
You send SK to let the receiving operator know s/he can
stop typing, then send the calls.

But if you're just ragchewing, who cares?

73, KR1S

Thanks. This at least makes sense, even if the reason isn't usually
of earthshaking importance.

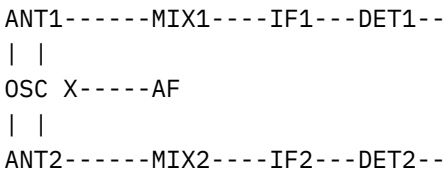
>one receiver?

Well, what you're supposed to do is tie *one* first oscillator, pick either
one, to the first mixers in each receiver. And then combine the *audio*
outputs of the two receivers. With separate antennas, you'll now get space
diversity reception which should reduce selective fading. The same thing
will work with two oscillators as long as you tune accurately and combine
at audio. The key is combining at audio. That way the phase differences
at RF don't matter.



>Simplistically I once heard a catchy synthesizer pop piece on the German
>station and set one receiver (the big old one) to 6100 and my DX440 to 6075,

>In fact, the wafting back-and-forth effect combined with the electronic music
>was very neat indeed.

This is called frequency diversity. Again, if you combine at AF the relative
frequency and phase difference at RF is not relevant.

>Today I was listening to the same frequency on both, using wire antennas less
>than one meter apart and found that the selective carrier fading was not
>exactly the same on both machines. Is this what 'diversity' exploits?

Yes, but you really want more separation between the antennas. Just don't
make it a multiple of half a wavelength. :-)

>Anyone care to reminisce about practical use of this technique? Is it still
>used or has it been obsoleted by SSB?

It still works, even on SSB, though you really have to use common
oscillators there, first and second, or the audio won't be exactly
the same frequency and phase out of the two receivers.

In the diversity operations that I've seen, the IFs are not tied together.
They go to a diversity RTTY TU, which dynamically selects whichever IF input
has the best signal. The old RCA unit that I bought for 2 bucks at a hamfest
claimed that it could switch between a mark and a space and not miss a beat!
I never tried it out, but should have kept it - neat panel and LOTS of tubes!

797. US Reciprocal Licsensing (was: Canada to US Amateur License

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-17 14:27:55 UTC
From: drt@athena.mit.edu
Message-ID: <DRT.93Aug17102752@e40-008-5.mit.edu>
Source record: 277827

In article <KLXot*++x@lhaven.UUmh.Ab.Ca> dreamer@lhaven.UUmh.Ab.Ca (Lawrence "The Dreamer" Chen) writes:

The possibility of me moving to the US might be lurking in the future....

I'm wondering what happens when I move to my Amateur Licence.

What does each of the Canadian License classes become under the US Licensing system?

Basic ->
Basic+5WPM ->
Basic+12WPM ->
Advanced ->
Advanced+5WPM ->
Advanced+12WPM ->

It doesn't quite work that way.

Canadians get automatic reciprocity; other than that, all that follows applies to all reciprocal licensees in the US.

In order to qualify for reciprocal operating privileges, you must:

1. Be a citizen of the country that issued your license (there must be a reciprocal agreement between your country and the U.S.)
2. NOT be an American citizen
3. NOT have an FCC amateur license
4. Get a permit, except for Canadians

If you meet these criteria, you get to use those privileges that:

1. Your type of license can use at home, and
2. Don't contradict the reciprocity treaty, BUT

3. You can't do anything an Extra can't do, and
4. The FCC can put more restrictions on you when they issue the permit, or at any time.
5. No-codes cannot transmit below 30 MHz.

Of course, you must have an FCC license to administer exams. If you get any class of FCC license, OR if you become a US citizen, your reciprocal authorization is void. No credit for exams is given on the basis of holding a foreign license. (Then again, here we pay no annual fee.)

Reciprical permits (which VEs don't need) are good for one year. You must reapply each year.

Canadians ID this way: "VE#$$$/W#"
Others (with their permits): "W#/??#$$$"

All foreigners must ID in English and include their location by city and state/territory/etc. at least once per QSO.

>Could you add what the US classes offer to, I've forgotten what they are.

No. (There are only so many hours in a day!)

Our rules are, well, complex compared to yours, and I suggest you pick up a copy of Part 97 and read it. (You can get it from the Superintendent of Documents or just buy the ARRL's FCC Rule Book.)

But I will include a sketch of Extra privileges. Maximum power is 1500 W PEP for all modes, with more exceptions that you can shake a stick at.

160: 1800-2000 cw,rtty,data,phone,image

80: 3500-3750 cw,rtty,data 3750-4000 cw,phone,image

40: 7000-7150 " 7150-7300 "

30: 10100-10150 " (200 W PEP Max)

20: 14000-14150 " 14150-14350 "

17: 18068-18110 " 18110-18168 "

15: 21000-21200 " 21200-21450 "

12: 24890-24930 " 24930-24990 "

10: 28000-28300 " 28300-29700 "

All the bands below allow all modes (with some bandwith restrictions on some of them) except where noted:

6: 50-54 (50.0-50.1 cw only)

2: 144-148 (144.0-144.1 cw only)

1.25: 222-225

These next 3 bands have geographical power restrictions. You need Part 97 to untangle them all.

70 cm: 420-450

33 cm: 902-928

23 cm: 1240-1300

There's more stuff above this. There are some other exceptions for places outside the continental US.

(This is just Extra. There are four more classes.)

So, as an example, a Basic + 5 can use everything above 30 MHz and below 4 MHz, but can't use phone in the 80m cw band, must restrict power to that which Basic operators can use at home, etc.

The observant from outside region 2 may notice that there are chunks of important region 2 frequency bands which, according to the rules above, they can't use. The classic example is 146-148 MHz, where many if not most of our repeaters are. I don't know what provisions the FCC makes for this sort of thing. "None" was the answer last time I looked, but I would welcome correction here.

>I can do all I want with my Advanced-class license.

I agree. Fortunately for those who aren't interested in Morse code,
no human being NEEDS an Extra Class license--or any ham license, for that
matter. It's a case of personal interest and choice. In my case, however,
I enjoyed tackling the challenge of learning the theory and 20-WPM code for
my Extra Class license as much as I liked doing the 5-WPM code and theory
tests when I started in 1976. It was fun to have a chance to work on earning
a goal, the Extra Class license and slight additional HF operating
privileges. That's one great thing about this hobby--you can always find a
new challenge to go after!

> preferably in the Windows environment. I found some programs to control
> the TS-440, but these programs don't work very well with my '450.
> Any help is appreciated!

Dick,

You might want to try the latest version of HamWindows Plus/RCS from
California Software (800-245-2741). It has a completely customizable
"you-build-an-onscreen-transceiver" graphic Radio Construction Set (kewl!),
logging, computer control of HF and VHF rigs, packet (and PacketClutter
spotting) operation, automated logging/QSL card printing, a world grayline
map with the CIA World Factbook tied in and linked to logged stations' call
sign prefixes (gives you instant access to geographical, political, cultural
and other data, plus ham terms in about 4 or 5 foreign languages!), and way
too many other features to type here, but it's amazing! (For example, you can
log onto your local PacketCluster and when it sees a DX station you need, it
automatically QSYs your HF rig to the frequency, puts the call sign,
frequency, mode, date and time into your log and can pop up the country info,
etc!)
You have to have a radio with a computer control interface (eg, the
Kenwood TS-440S needs the optional IF-20 or whatever it's called), and all the
Kenwood TS-x50 series rigs will work, as will most new ICOM, Yaesu, Ten-Tec
and SGC rigs.
Your computer has to be AT LEAST an 80386SX-33 or better IBM compatible
running MS Windows 3.1, with a recommended minimum of 8 megs of RAM and at
least 2 serial (COM) ports (3 or 4 is better, especially to use VHF and HF
rigs, a TNC, etc).

I believe the software starts at about $130, depending on the modules you
want (some are optional). I think it's niftee!

GL!

Date: 1993-08-17 15:07:29 UTC
From: edmitch@microsoft.com
Message-ID: <1993Aug17.150729.18276@microsoft.com>
Source record: 277721

Automatic Vehicle Location was made a primary user of 902-928 MHz about 3 years ago.

A couple of months ago, the FCC released of Notice of Inquiry asking for thoughts on expanding this from Vehicle location to generic Object location (in other words, you car, your kids, your wife, your co-worker, your lost dog, your power saw you misplaced, etc).

In the NOI, the FCC mistakenly wrote (they say) that they wondered if Part 15 and ham users should be removed from 902-928 MHz. A few days later the FCC retracted that statement! Said that a word was missing from the statement; something about they meant to say that the band must continue to accomodate hams and Part 15 users.

Anyway, our hold on 902-928 MHz was never very strong anyway.

Remember we lost 92 MHz of spectrum from 1980-1989 making 1989's loss of ONLY 220-222 MHz a great year for ham radio! After all, that was far less than the decade's annual average loss of ham bands!

>DC systems, the color code matches AC.

The reason that old time auto's were positive ground is that the plus
terminals of tar sealed car batteries leaked. The acid tended to eat away
the wires connected to this terminal. So, rather than fix the battery's
leakage problem, they used a cheap, uninsulated braided strap for the
plus connection, and made it ground, to prevent accidental short circuits.

If they used a cloth dial cord, you can use standard "bait casting" fish line.
If it is a plastic coated metal wire, use either nylon coated steel fishing
leader, or model aircraft control wire.

You might consider using the filter that Mot puts into the Minitor,
part number NLN7834A, "Permacode Active Filter". I bought a few at a
hamfest last week for $10.00 each and the Minitor manuals, 68P81042C60,
and 68P81042C50-A, also for $10.00.

The filter has four pins on .1 inch spacing: in, out, +1.2VDC, and gnd.
You must capacitively couple the input and output. I measured the 3db
bandwidth of a 902.3 Hz filter to be about 6 Hz. At resonance, a few
mV of tone in will produce a few hundred mV of tone out. Mix in a
couple op-amps and some logic. The manual gives typical signal levels,
DC voltages, and circuit connections.

>packet radio? Isin't that considered retransmission?

For the purposes of this discussion, no it is not. Any connections your
home machine makes are treated as just wireline extensions of the machine.
It's only if you contact third parties, live people, and repeat their
messages over the air that you would have a concern about retransmission.
And that's legal anyway in the US as long as you maintain control of the
radio transmissions. (Note, since both transmitters are in the US, you
could wireline to another country and still not be handling international
third party traffic under the rules. To qualify as international third
party traffic, the *radio* signals have to do the border crossing.)

>From what I've learned from Gary's post and others, Packet seems the way I
>want to go. Now, two more questions:
>
>1) Are there any magazines that are a good source of packet info?

All the US amateur magazines print packet material of varying quality.
None are particular to packet anymore, Chet Lambert's mag folded. There
is a good newsletter that you get if you join TAPR, but it's not on
the level that you need. And most of the books that have been published
are hopelessly out of date, and/or aimed at too simplistic a level. Packet
is evolving quicker than press runs can follow. The best printed resource
available is the collected Computer Networking Conference proceedings
published by the ARRL. If you get all the volumes, and remember that
things have evolved greatly since the first was published, you can get
up to speed on packet technology.

>2) How much is this going to cost me? Say, for example, I wanted to put in
>a 9600 (or even 57.6) capable station w/ antenna, the material necessary
>for the mobile station, etc.. Can anyone suggest what an area for costs
>will be? I'm a HS student, and can't really afford to drop an incredible
>amount of money in a station.. (Sigh).

Ok, let's look at a simple 1200 baud 2 meter setup. You'll need 2 TNCs
at $140 each, 2 radios at $330 each, and two antennas, a base at $120
and a mobile at $40, plus assorted cables and a power supply for the

base radio, say another $150. That gives a grand total of about $1200.

That's if you just go out and wave your checkbook at a dealer. If you shop the fleamarkets carefully, you can find suitable old Motorola or GE radios for $50 each, or something like an IC22A for a few bucks more or less. You can build a Baycom style modem from parts for under $20 and ftp the software from one of the archive sites. And you can make your own base antenna out of some copper plumbing pipe for another $20. You'd best still buy a mobile antenna and mount for $40. And you can use a car battery, $24 on sale, to power the base rig. And you'll need a couple of amateur band crystals for the radios, another $40, and maybe $6 worth of wire. Now you're looking at about $270 for two stations. That's about as cheap as you can go.

If you want to go 9600, you need those two $140 TNCs and two $100 9600 baud modem boards to fit in them. You may find TNCs at flea markets for $65, and I caught a deal with Pac-Comm at Dayton where they were selling the 9600 baud boards for $89. So add $308 to the above 1200 baud setup and subtract the $40 for the baycoms for a total of $538 for two 9600 baud stations.

To do 56 kb, you need two GRAPES RF modems at $250 each, two transverters at $155 to $780 each depending on what you want, or can find, and a digital interface at each end which can either be an Ottawa PI card or a souped up TNC (GRAPES shows you how) either for about $120-$140. That totals about $1140 for two stations, plus another $60 for antennas and feedline, or about $1200. About the same price as a bought all new 2 meter 1200 baud station pair, or a medium performance HF rig.

Obviously, if you have a partner for the other end, you can divide these prices by two.

If you really want the definitive answer, purchase a copy of Part 97
Rules and Regulations and READ IT. It states, in plain English, that
the operating station and operator/station license is subject to inspection
by the FCC. . . no reason is needed nor required. Any licensee refusing
an inspection is subject to revocation of the license and/or fines.

I picked up a package of dial cord at my local Radio Control hobby shop.
RC people use it in RC planes for control cables for pull-pull rudders
and spoilers. I got 6 feet for ~ $2. It looks identical to the dial cord
in my old McIntosh tuner, black, double braided ~ 1/16 dia)

First off, one way to ensure interesting items appear on this
group is to post some loggings or reviews of programs, etc!

Diversity reception does involve more than one receiver, with
separate antennas, separate frequencies, or both. A quick hand
on the gain controls, or automatic selection of the strongest
signal is required to get the maximum benefit from this system.
I believe diversity reception was pioneered by RCA at its
transatlantic receiving site on Long Island, NY, but I'm not
sure.

One well-known diversity setup from WW2 used a pair of
Hallicrafters SX-28 receivers and some additional electronics.
With 2 receivers dedicated to each frequency, it's easy to see
why there are still so many SX-28s in circulation!

Good listening.

Jim

>but what good is that if all you can hear is intermod? The same holds true for
>the TH-78A, despite it's built in arcade game. The test of an HT is how well
>you can use it, and the Standard has thus far exceeded all of my expectations,
>as well as the advertised claims made by Standard. It's also built like a brick
>shithouse.

I have a Realistic HTX-202 and love it because it does not receive out of
band and does not have intermod problems. I have heard other HTs pick up
royal trash whereas the HTX-202 remained clear as a bell. Of course, it
can't do anything about the intermod coming over the repeaters. :-(

The aspects of the HTX-202 I do not like are its short battery life on
transmit (it lasts 14+ hours typically on receive) and the fact that its
low-power setting can't be easily reduced -- two to three watts is often
much more than I need for getting into the repeaters with a 5/8-wave
antenna. I can probably get into the 146.940 repeater in Louisville
with a paper clip on low power. :-)

Cross-posted to: sdnet.general,rec.radio.amateur.misc,misc.wanted

I had a bud send this to me. Hadn't heard about this product (at such a low price) til now. Thought it might be of interest...

RNet(TM) Paging Data Receiver
o Based on the company's BRAVO Plus(TM) pager technology
o 20-character message buffer
o Programmable headers and trailers to let users define specific characters at the beginning and end of transmissions

Motorola introduced its RNet(TM) Paging Data Receiver, a board level OEM product that received and decodes data broadcast over existing paging networks. The receiver operates on 138-174, 435-480 and 900 MHz channels. Data can be received, decoded and sent at 1200, 2400 or 9600 baud via a serial RS-232 or TTL interface to the manufactuers host equipment. Equipped with three output control ports, the unit can be programmed to activate or deactivate various electronic switches. The receive can accommodate any size and number of seven-bit ASCII numeric or alphanumeric messages, limited only by the speed of the data acceptance from the host computer. The unit's multiple addressing capability includes four addresses and can use four functions within each address. For Group Call applications, receivers programmed with the same Group Call code are alerted to a message simulraneously with a single transmission. The receiver measures 4.3 x 2.8 x 0.75 inches and is priced at $130 per unit, based on quantity.

I once worked on a Microwave system that had four receivers and used space and polarity diversity. There were two antennas spaced about 100' apart and each one had a vertical and a horizontal feedhorn, giving four different receive signals (at the transmit side there were two transmitters, one vertical, one horizontal). The audio (wideband audio 0-120Khz) from the FM detectors were sent to a combiner which dynamically selected the one with the best S/N ratio (by comparing the 104 Khz pilot tone vs the white noise at 80 Khz). The four receivers where only tied together at the audio level, none of the oscillators were synchronized or shared. Any receiver without a pilot tone was excluded from the selection process.

The reason for using diversity was to reduce the dropouts caused by the fast and slow fading that is commonly experienced over a microwave troposcatter link. With the four different paths, most of the time you had an adequate S/N over at least one of them (and usually over more than one).

I've heard that a few high end cellular car phones have diversity reception, using space diversity. They use two receive antennas spaced a few feet apart, then select the best signal of the two. This reduces the fading caused by multipath reception, since (hopefully) both antennas won't be in a null at the same time.

I'm not too familiar with the difference in the -A model.

IMO the SB104 was responsible for the demise of Heathkit as a viable supplier of amateur radio equipment. It was one of the first all-solid-state radios, but they didn't take the time to work out the bugs. The problems as I remember them:

Crummy sensitivity. Sensitivity is rarely a problem with any modern transceiver since atmospheric noise normally covers up receiver noise. The SB-104 was the exception. I think they spec'd 1 uV.

Terrible dynamic range. It takes quite some doing to have rotten sensitivity and bad dynamic range in the same receiver, but Heathkit managed it. As I recall, they used standard switching diodes (rather than PIN diodes) to switch the front end filters, and I always figured that was what caused the problem.

Excessive spurious signals on receive. If you tune across 10 meters when the band is quiet, you hear whistles, beeps and burps across the whole band.

Spurious signals on transmit. The one I particularly remember had to do with the remote VFO. Both VFO's run continuously, even when not in use. Because the transistor switch for the VFO outputs only has about 40 dB of isolation, your transmitted signal is only about 40 dB down on the unused VFO. It does it on receive, too (i.e. you can hear weakly on the unused VFO.)

On the subject of the remote VFO, the spotting procedure was, to say the least, crude. To spot the remote VFO to the internal VFO, you memorize the frequency from the digital readout, switch to the remote VFO, and tune it for the same frequency reading!

Transmit oscillations on 10 meters. The unit I had would develop an intermittent oscillation on 10. If you banged the cabinet, the oscillation would usually go away. Turned out one of the PC boards was grounded to a shield with beryllium copper finger stock. After a time, the copper would react with the aluminum shield and oxidize.

The ground was necessary to keep the PA from oscillating.

Seems like there were several other serious problems, but I forget what they were. If you buy the rig (don't pay too much money for it!), go back and check the ham magazines for the couple years after the rig came out. There were lots of articles on how to modify the SB-104 to fix its numerous problems.

Yes, cellular phones have made it much easier to get an HT through
security. Of course this only works when you have a DTMF pad attached
to the HT.

The security people at Pearson (Toronto) thought my FT-470 was the
neatest "cell phone" they had ever seen :-)

> -- Greg KE4DPX

The "definitive" answer doesn't cover an unlicensed individual however.
Remember...ownership/possession of ham equipment is not illegal. The original
thread of this discussion had to do with a person belived to be unlicensed
who had an HT (and may actually have used it, although no posting I've seen
offered any conclusive evidence of that).

So, continuing, it isn't clear to me (other than because part 97 currently
states it) that a ham with an HT should be subject to anymore interogation
or license inquiry than a non-ham with an HT. That is even more at issue
these days since the FCC no longer issues station licenses and thus, there
no longer is any clearly defined (by location) amateur station license
on FCC record.

Now it certainly seems possible that I might be out somewhere with my HT
and "listening," but not transmitting with an HT. Under that scenario I don't
need to have my license with me as I see it. Why should I? Therefore,

unless the FCC had definitive proof that I transmitted on the HT AND then inquired as to my license, I can't see what I'd be in violation of.

Speaking of plain English, a number of people misunderstood my point.
Yes, the FCC can ask to see your license. The question was, what could
they do if you said that you weren't going to show it to them, and they
didn't know who you were? They couldn't revoke your license if they didn't
know your name or callsign.

Please notice the past tenses in the above sentence. The question has been
answered to my satisfaction.

830. Phase Linked retransmissions

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-17 21:47:04 UTC
From: linnig@m2000.dseg.ti.com
Message-ID: <LINNIG.93Aug17154704@m2000.dseg.ti.com>
Source record: 277762

Forgive the wild hare nature of this...

Has anyone ever linked multiple ham transmitter sites together so that they form a phased array antenna? I'm talking about sites significantly far apart -- say as much as a mile.

Imagine a local ham club could link each members transmitter together so that they were transmitting the same information in phase lock. Actually, you'd want the transmitting sites to be delayed in some way to achieve a killer directional beam. Perhaps you could send the original signal from one site to the others on a 2m link.

```
\
\ |
| |
T | |
T | |
| | =====> DIRECTION
T T | | OF
T | | TRANSMISSION
| |
/ |
/
```

I'm not sure how the FCC would treat this, perhaps the individual transmitters could be considered repeaters -- no problem. You would then effectively have a 5 KW transmitter (assuming the individual transmitters were 1KW). If the FCC treats such an arrangement as a single transmitter then you back each down to get the sum total to be less than the legal limit. Even then, I'd expect you could a fine directional antenna.

This idea occurred to me after looking at some military phased array radars and I wonder if anyone ever did it at HF.

: Anyone care to reminisce about practical use of this technique? Is it still
: used or has it been obsoleted by SSB?

Many of the professional wireless mics used in the VHF-FM bands
use space-polarization diversity to reduce fading.

The HME wirless we have at church has two BNC's on the back. The manufacturer
provided some quarter wave antennas and suggested that they be placed on
the back of the receiver oriented +45 and -45 from vertical. This is
why I said polarization diversity. The distance between the bases of the
antennas is about eight(8) inches. The frequency of interest is 174 MHz.
so this is much less than a half wavelength.

Bruce Perens (bruce@mongo.Com) wrote:
: I'm trying to get to 20 WPM code for the extra class license. I've
: passed the theory tests through advanced, and extra theory won't be
: a problem.

: 1. Am I doing something really wrong? Progress comes very slowly. It's
: getting rather frustrating.

It took me about four months of 30 minutes/day practice. I understand
your frustration. I hit a wall at about 15 wpm. I got through it by
listening at 18 (oy!) then backing down to 16. I did the up-3/down-2
ratchet all the way to 22 wpm, then passed the test.

: 2. I see claims about people copying at astounding rates, some claim 75 WPM.
: Can these people copy random character groups at this speed?

It's probably an inflated ego talking. 75 wpm is probably the 99.99%ile
on the planet.

: 3. Do most hams who copy at 20 WPM only recognize "the usual QSO words" at
: that rate?

The Extra test is actually very close to plaintext because the VEC gets
500 letters for the test. The Novice test is severely restricted to the
point that you can predict where most of the prosigns are going to be.

I actually passed on the 1-minute solid copy option. The key is to use
the Wheel-of-Fortune(tm) method previously described. There's usually a
minute (100 letters) somewhere on the copy sheet. Pay closer attention
to numbers and prosigns - they count double and for me they're actually
EASIER to copy.

The other skill I developed to pass 20 wpm is the ability to buffer
several letters in my head while my hand caught up on paper. I think
this skill is what others refer to as "head copy" or "word copy". Plain
text usually has a good intermix of small (e.g. "e", "i") characters
and long ("j", "o") characters, so you can catch up (or relax) during
the long characters.

Also, be sure to write down the long letters - it works well with the
Wheel-of-Fortune(tm) method. Part of learning higher speeds is to
abandon the anal-retentive idea of copying every character. If the
letter doesn't immediately come to mind, forget it - it's better than
trying to remember it and missing the next two. Later analysis of your
missed letters will tell you what you need to put in your random letter
groups. :-)

: 4. Is there a "Farnsworth" variation where it is the word space that is
: lengthened rather than the character space? I would think that this
: would aid training in word recognition. Is there any PC software
: that implements this?

I abandoned Farnsworth at 13 wpm because our local testing team does not use it. You may want to ask your testers what they use if you don't already know. Don't bother practicing for something that won't be on the test. I learned Farnsworth-13 and failed the straight-13 test.

: Bruce Perens KD6OTD

Good luck with your upgrade,

Perry Scott

Source record: 277735

RD> From: rdewan@casbah.acns.nwu.edu (Rajiv Dewan)
RD> Newsgroups: rec.radio.amateur.misc

RD> I am interested in weak signal RTTY DX. I have a few questions:
RD> How good are AEA2232 and Grace DSP12?
RD> How do they compare with HAL and Tono modems?
RD> What software is good for RTTY operations?
RD> How would PK232 optimized for RTTY and a W9GR DSP
RD> filter compare to above?

I haven't tried the Grace DSP12 but the AEA2232 doesn't compare well at all for 45 baud RTTY with the HAL ST6000 or the Flesher TU470.

Software...I like quite a few different ones. The HAL DSRTTY is nice, I use the PK232 software. The Interflex PKGold types are nice.

Your last question would be an interesting test. Part of the question in weak signal work would have to be what frequency range? There are significant differences between say 80 meters and 20 meters. Also location in the country and propogation plays an important role. Here in the Pacific Northwest Polar flutter on 20 is a big problem, where on the East coast it might not be significant. Multi-path and distortion on 80 is a problem.

RD> Any pointers in setting up a serious RTTY station will be appreciated.

A serious RTTY station requires lots of aluminum in the air like all other serious stations. As far as serious RTTY gear I would use a HAL ST-8000 if the budget permitted or a AEA PK232 with external filters such as a Dovetron which can be had surplus for $50 doing regen. I currently use a Flesher TU470 AKA Heathkit HD3030 into a PK232 and a HAL ST-6000. The advantage of the ST-8000 is that it can do about anything.

The AEA PK900 which I am playing with at the current time seems to work pretty well on RTTY.

We're about out of N8xxx callsigns here. The local VE team said that the next group of calls would probably be in the KB8xxx call group. That seems a bit unexpected since the novice calls are currently issuing with the KB8 prefix.

What I'm wondering is, why are we going back to the Kx call prefix instead of continuing with the Nx prefix for technician and general?

I guess I don't mind my current N8WED. It was interesting enough that I decided to keep that call eventhough I have an advanced license. ...and it is reasonably short in CW.

> 73s

No they can't and you still could not transmit in the amateur bands if they could tell you your call. According to Part 97,5(a), "the person having physical control of the appratus must hold an FCC-issued WRITTEN (emphasis mine) authorization for an amateur station." Additionally, "The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station." Part 97.9(b).

Please don't call the FCC. It only slows down the process since instead of processing applications, they must answer phones. Please help them upgrade their system by not slowing them down.

838. CMOS Super Keyer II & TS-520S ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 04:27:28 UTC
From: mohan@tulip
Message-ID: <1993Aug17.232729.5429@uoft02.utoledo.edu>
Source record: 277767

Hello,

I have a question for those using the CMOS Super Keyer II with TS-520S.

Did you have to add a Level-converter circuit like described in the article
"Cheap and Easy Control-Signal Level Converters" in QST, February 1990.
or are the Keyer levels ok for the TS-520S.

Thanks for any information you provide.

839. Is there such thing as an omnidirectional antenna in 3 dimensions?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 06:02:06 UTC
From: roberts@ishtar.med.jhu.edu
Message-ID: <24sgku$bnm@mozart.amil.jhu.edu>
Source record: 277769
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.equipment

[I originally posted this to sci.electronics, but I thought that the device that I'm looking for might be something that is in common use by amateurs and broadcasters. Sorry if it doesn't seem relevant. dcr]

Hi all,

I'm looking for an antenna of some sort that I can use as an omnidirectional field strength indicator. We have a system that produces 3 orthogonal (at 90 degrees to one another) magnetic fields at 3 frequencies. The 'emitters' are mounted on a 40 inch cubical frame, so that at the center of the cube, you get 3 fields that are approximately orthogonal to each other. We use it to measure the gaze direction of the eyeball by placing a small coil of wire embedded in a contact lens onto the eye. A wire is run from the eyecoil to an amplifier which separates the 3 frequencies and gives us the strength of each of the fields as picked up by the (very directional) coil of wire. To get our math right, we need to detect the relative strength of the 3 fields very near the eyecoil.

From basic Electricity and Magnetism, I think that a point is the only 'perfect' omnidirectional antenna. What I'm looking for is some real-world, practical implementation that is omnidirectional to within a small fraction of a percent. Does anyone know if such a thing exists? Ideally, it should be fairly tiny (< 2cm or so) since I'm working on a relatively small scale.

Thanks in advance,
dale, roberts@ishtar.med.jhu.edu

840. Need information on duplexers

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 10:17:25 UTC
From: jdwhite@iastate.edu
Message-ID: <CBy9x3.IGt@news.iastate.edu>
Source record: 277770
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

I would like to learn more about duplexers and how to maintain and "configure" them. Any suggestions on where I might look for some good information. I looked in the '92 Handbook, but all I found was a paragraph on what duplexers were; nothing on how to maintain them.

Hiya Everyone! I've been tipped by a friend about a hamfest participant who was selling a really interesting toy. So interesting it woke me up at 6:52 in the morning to post this.. heh.. Not really, but here goes.

If anyone out there knows, approximatly how much power do Police radar guns use?

Would anyone have a Schematic for a Radar Emitter? i'm looking for one i can make approximatly the size of a Garage Door opener, and hopefully easily! Also i was wondering if one had such an item powered by a 9v battery, and it was wired for a vehicle's cig lighter, would output power increase, or would you be morelikely to fry the thing?

I also heard from someone, that Popular Electronics has made a schematic detailing this idea, but i never had a subscription =(

Thanks in advance!
Jeff

846. Re: 'Diversity Operation'?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 13:23:59 UTC
From: gardner_a@kosmos.wcc.govt.nz
Message-ID: <24tahfINN5g3@golem.wcc.govt.nz>
Source record: 277777
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

There are (to my knowledge), 4 different methods of diversity reception, all with different advantages. Some of them work better on >30MHz while others are more suited to data than voice transmissions. Frequently, more than one method can be used at once.

1. Frequency diversity

This is where 2+ receivers are tuned to two different frequencies carrying the same programme. The theory is that when one frequency is in a null, the other will hopefully be not in a null! This method saves space at the receiving site, as only 1 antenna is required. The transmit site, however, has to run 2 transmitters. Transmitters aren't cheap and consume power!

2. Space diversity

THis is where 2+ receivers are attached to aerials that are physically seperated by (usually) a multiple of wavelengths. The theory is that while one antenna is in a null, the other isn't. Only one transmitter is required, but you may need a fair amount of real estate for the receive aerials!

3. Polarization diversity

Due to size constraints, I think this is used mainly >30MHz. THe theory is that while signals of a horizontal polarisation may be in a null, signals of a verictal polarisation won't be. Many microwave links over water use this method combined with space diversity.

4. Time diversity

THis is where 2 signals are sent from 1 transmitter to 1 receiver at different times (i.e. the programme is re-run). Once at the receive end the 2 signals are combined and any nulls (hopefully) are cancelled. Doesn't work to well for voice, more suited to data, I think.

I recall that the HF receiving station I used to work at here in New Zealand had a triple diversity receiving unit. This was 3 RCA AR-88's in a 19 inch rack with a common IF unit that would select the strongest signal. You could use it for space or frequency diversity. We had 2 HF vee array towers spaced approx 1 mile apart. Each tower had around 24 Vee aerials running off it at all directions of the compass. This was a fun machine to drive!!!

>In rec.radio.shortwave, mwandel@bnr.ca (Markus Wandel) writes:
>>This may be a FAQ, and yes, I am one who unsubscribes to these groups when
>>nothing interesting passes by for a while so I may have missed it in the past.
>>I am wondering about 'Diversity operation'.
>>
>
Well, there are at least three types of diversity reception; space diversity,
frequency diversity and time diversity. If you are listening to the same
broadcast on two different frequencies, this would most likely be
frequency diversity. Space diversity would be akin to listening to the same
frequency with different antennas. The only example of time diversity that
I could come up with would be forward error correction telex over radio,
where everything is sent twice at different times; I'm certain there
must be other examples.

I recently saw an interesting article where space diversity was used for
INMARSAT standard 'C' communications. Two antennas were mounted at different
heights on a fishing trawler's mainmast, and apparently resulted in much
improved reception of the satellite in areas of marginal coverage.

From: morris@ucunix.san.uc.edu
Message-ID: <24tgup$i89@ucunix.san.uc.edu>
Source record: 277708

On a lark, I picked up an old radio at a garage sale...looks intriguing but I've never heard of the manufacturer. The semicircular dial has four concentric bands, marked 160, 75/80, 40, and 20 meters, and has the notation "TOBE AMATEUR COMMUNICATIONS RECEIVER MODEL H." The actual tuning knob's faceplate has the notation "TOBE MODEL 36." The tube complement seems to be 40, 80, 75, 6D6's (several) and 6A7. None of the various knobs on the front panel have decals (left) but maybe this was a kit? Looks very well machined and solid, fairly clean inside although there's some gunk on the top of the black, wrinkle-finish, trap-door-top case. The audio goes out to an external speaker with a 30K input xfmr in the speaker case.

No markings of patent or trademark info, so no dates, etc., on the chassis or case anywhere I've looked so far.

Oh yes, so far all I get is audio hum, but that's where the fun will come in... (-:

Thanks for any info on this unit or TOBE in general.

[descriptions deleted]

Add, angle diversity, which is used on microwave troposcatter links. Two directional antennas are aimed at slightly different regions of the sky. Principle can be applied to any technique where there is a distributed scattering source being used.

851. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 16:25:15 UTC
From: jfw@ksr.com
Message-ID: <30876@ksr.com>
Source record: 277684
Cross-posted to: sci.electronics,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.info

[$Revision: 2.14 $; last updated August 18, 1993]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations. Note that sending $1 along with catalog requests is a big help for these folks.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
+1-800-866-6626 (orders)
+1-401-596-3080
+1-401-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
+1-603-635-2235
+1-603-635-2943 (FAX)
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog (but note that they are STILL (12-May-93) out of catalogs and it will probably be months before the next one is ready).

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
+1-800-528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs). Export orders have a $100 minimum, except for Canada and Mexico.

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
+1-800-DIGI-KEY (334-4539)
+1-218-681-3380 (FAX)
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7
+1-800-677-8899 (Main number for US and Canada)
+1-514-630-7410 (International)
+1-514-697-8112 (FAX)
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 8 stores in the US (Santa Clara CA; Chicago IL;

Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Each store has its own 800 number and FAX number, call the main number(s). International orders are to be mailed to the Canadian address, but they want payment in US funds! Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Maplin Electronics Ltd.,
P.O. Box 3,

"Over here [in the United Kingdom] the main hobbyist electronics supplier is Maplin Electronics who stock a wide variety of equipment. They have a catalogue which can be shipped for 10.65 pounds sterling by air or 5.50 pounds sterling by surface mail. They accept Mastercard, American Express and International Reply Coupons. They have at least one type of air-filled variable capacitor!" (Thanks to Kev White at Cambridge University).

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
+1-312-784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets. Also note that they have six Canadian offices, and one UK office, and will take international orders at 500 N. Pulaski St., Chicago IL 60624-1019, +1-312-784-5100 (FAX +1-312-638-7652, TLX 6718690 NEWARK U).

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division

1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
+1-800-93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
+1-800-543-4330
+1-800-824-TECH (product questions)
+1-513-434-6959 (FAX)
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
+1-800-695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
+1-800-831-4242
+1-800-237-6948 (FAX)
+1-415-592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: +1-800-538-5000
Cust. Service: +1-800-538-5001
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
+1-408-257-8614
+1-408-253-6288 (FAX)
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
+1-800-423-0070 (orders)
+1-602-945-7736 (stock/price checks)
+1-602-994-1707 (FAX)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling.
Wide array of ICs, good assortment of electronic components.

EasyTech Inc *** out of business? ***
2917 Bayview Drive
Fremont CA 94538-9932
11 May 93: "EasyTech no longer has an 800 number, and has dropped several lines. The last time I called them (2 months ago), I got the impression they were slowly going down the tubes..." - dts@banyan.com "Both of their 800 number and the customer services numbers are disconnected, and no new numbers are given." - lau@gandalf.rutgers.edu

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
+1-800-325-0101 (US & Canada)
+1-503-336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
+1-800-645-9212
+1-516-349-7620
+1-516-349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff, overnight, export (like to Hawaii :-), and etchant; based on UPS charges). Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
+1-800-848-8001 (Orders)
+1-215-788-5583
+1-215-788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30; Most items are new overstocks, much regularly stocked stuff as well. Tools, electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
+1-800-826-5432
+1-818-904-0524

+1-828-781-2653 (FAX)
$10 minimum, $4.00 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
+1-408-943-9773
+1-408-943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
P.O. Box 48838
Niles IL 60714-0838 ### New address.
+1-708-475-8440
+1-708-864-1589 FAX
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras, velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains, you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
+1-214-343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping (extra for Alaska & Hawaii). Surplus electronics, pretty random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
+1-419-227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
+1-800-524-6464
+1-614-264-5414 (FAX)
No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
+1-800-4-HALTED Orders only
+1-408-732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10 ($2 handling charge under $20), plus UPS shipping cost. Has three stores, of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
+1-407-848-8236
+1-407-844-8764 (FAX)
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: +1-800-642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: +1-216-621-1121
fax: +1-216-621-8628
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog. Local store, a cleveland institution, is called Electronic Surplus, Inc., and has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1502 Jones Street
Omaha, Nebraska 68102
+1-402-346-4750
+1-402-346-2939 (FAX)
New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
+1-800-527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but all well used). Prices seem relatively high, and you'll be shocked to learn how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and they certify the used equipment to meet the original specification and warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
+1-800-235-6222 (Ex. CA)
+1-818-787-3334 (CA)
+1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017

Fort Myers FL 33906-6017
+1-800-JAN-XTAL (Monday through Thursday)
+1-813-936-3750 (FAX)
+1-813-936-2397 (plant)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
+1-800-237-3061 (M-F) (US and Canada but not Alaska and Hawaii)
+1-813-936-2109
+1-813-939-4226 (FAX)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
+1-800-426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
+1-213-763-5770
+1-213-763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
+1-619-747-3343
Toroid cores and shielding beads.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
+1-516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]
13980 NW 58th Court
P.O. Box 4650
Miami Lakes, FL 33014-0650

+1-305-557-7955 Customer Service (ask for Mirta)
+1-305-558-1255 Catalog (ask for Elizabeth)
+1-305-557-8004 Custom-made Parts (ask for Ziggy)
+1-305-557-8005 Non-standard Sizes
of catalog parts (ask for Eric)
+1-800-423-9009 Toll free FAX line
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets, tools,
wire-size drill bits (as in #61 size for PC board holes).

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously
supplied by Ed Hare and Mike Gruber at the ARRL.)

624 Kits
171 Springlake Drive
Spartanburg SC 29302
QRP kits (including some designs from W1FB's books) and some parts.

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
+1-714-952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz
postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
+1-602-820-5411
Note: Broadcast receiver kits

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT
England
Phone: +44 327 60178
QRP, transmitters, receivers, misc. "The Heathkit of England", though
with assembly manuals not as detailed, also without the intricate mechanicals
of Heathkits.
[Carried by Townsend Electronics (at least) in the US]

Communications Concepts Inc.
508 Millstone Drive
Beaver Creek, OH 45434
+1-513-426-8600
+1-513-429-3811 (FAX)
kits for Motorola Applications Notes (amplifiers and the like), small
assortment of components (chip capacitors, transistors). $4 Shipping&Handling.

Down East Microwave
Box 2310, RR#1
Troy, ME 04987

+1-207-948-3741
Note: Microwave preamps

FAR Circuits
18N640 Field Court
Dundee IL 60118
Printed circuit boards for articles in the usual ham magazines. SASE for list. $1.50 shipping and handling per four boards.

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535
+1-716-392-9430
Note: Amateur, general interest

John Langner WB2OSZ
115 Stedman St.
Chelmsford, MA 01824-1823
+1-508-256 6907
Slow Scan Television for IBM PC.

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England
Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
+1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
+1-717-248-2507
Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
+1-716-924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and pretty inexpensive, and you get about what you pay for. Their new VHF transceiver kits (144, 220, 440) look pretty interesting. Many have complained about the quality of their kits, though.

Tejas RF Technology
P.O.Box 720331
Houston TX 77272-0331

+1-713-879-9300
+1-713-879-9494 (FAX)
Tejas Backpacker-II QRP kit and other things.

Townsend Electronics, Inc.
Box 415
133 N. 1st Street
Pierceton IN 46562
+1-800-944-3661 (US only)
+1-219-594-3661
+1-219-594-5580 (FAX)
C. M. Howes Communications kits. Radio mounts. RSGB and ARRL publications.
$1 for catalog. $4 shipping & handling.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
+1-800-842-3748
+1-616-796-0920
+1-616-796-6633 (FAX)
Send $1 for a flyer. Some parts, QST article kits, transceiver kits,
QRP stuff in general (they inherited the stock from Small Parts Center
when they closed).

Dan's Small Parts And Kits (Formerly KA7QJY Components)
1935 S. 3rd W. #1
Missoula MT 59801
+1-406-543-2872
Send a business-size SASE for a current list of parts. RF parts, including
vernier drives and air variables; now also offers kits. $3.75 shipping,
no minimum. Fast service, lots of satisfied customers.

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034
+1-213-474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio
Electronics, etc., and a few of in-house design. I also sell IC's, etc."
Send a SASE every now and then for his most recent flyer. He also has boards
for some Motorola Application Notes.

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

Howard W. Sams & Company
P.O. Box 7092
Indianapolis, IN 26207-7092
+1-800-428-SAMS
Publishers of SAMS PHOTOFACTS and many other electronics books. There is an Annual Index of SAMS PHOTOFACTS whose cost I have forgotten. In-print Photofacts run between $14.95 to $39.95 (for computer Photofacts); they will photocopy out-of-print Photofacts for $11.95 + $2.50S&H for one page, plus $.55 per page thereafter.

RF Design Magazine
P O Box 1077
Skokie IL 60076-9931
+1-312-762-2193
A magazine for professional RF designers. Subscriptions are $38 per year in the US, $48 in Mexico and Canada, $51 elsewhere, unless you appear to be a "qualified subscriber" (i.e. are in serious danger of convincing your company to buy a $12,000 spectum analyzer based on an ad) in which case it's free. Heavy on theory, and even the advertisement articles are educational.

Electronics Now (formerly Radio Electronics)
Subscription Service
P.O. Box 51866
Boulder CO 80321-1866
+1-800-999-7139

A magazine for thumb-fingered electronics hobbyists. Subscription rate on the bingo card in the November issue (the latest I was able to dig up) was $19.97 per year.

Popular Electronics
Subscription Department
P.O.Box 338
Mt. Morris, IL 61054-9935
+1-800-827-0383
Like Electronics Now. $18.95 according to the latest bingo card I see.

The Computer Applications Journal (Circuit Cellar INK)
P. O. Box 3050
Southeastern, PA 19398-9932
+1-203-872-2204 (FAX)
This magazine is what Steve Ciarcia wanted BYTE to be when it grew up. It focuses on microcontroller applications and other digital projects.
$21.95 per year (12 issues, now) (Canada, Mexico: add $10 surface mail, $20 air mail; other countries: add $28.)

NOTES:

This file, and many others, are available for anonymous ftp from ftp.cs.buffalo.edu. It is also available from another anonymous ftp site, toxicwaste.mit.edu:/pub/archive/sci.electronics/Mail_Order_Companies. (Contact warlord@athena.mit.edu to offer things to the latter)

CHANGES FOR $Revision: 2.14 $

Add some FAX numbers, use +1-xxx-xxx-xxxx style phone numbers.
New address & phone for Communications Concepts.
Add Tejas RF Technologies.

852. Drake TR4C Tuneup help needed.

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 16:51:30 UTC
From: weinkar@aa.wl.com
Message-ID: <1993Aug18.115130.1@aa.wl.com>
Source record: 277680

I just purchased a Drake TR4C, and am a little unclear on the tune up procedure. Can someone give it to me, with a little explanation as to what each function is performing? (The manual is badly copied, and I seem to be missing some info, it's unreadable.)

853. Kenwood SP100 external speaker unit wanted...

I was wondering if anyone has modes for the Standard C558A HT.
If so I would appreciate receiving the instructions.
Incidently, the C558A is a GREAT HT.
Thanks for your help.

>
>David.

I've been told of an alphabet which goes something like
this:

Anna, Boris, Vasiliy, Galina, Dmitri, Elena, Zhuk, Zoya, Ivan,
Ivan kratkiy, Kilovatt, Leonid, Maria, Nikolai, Olga, Piotr,
Roman, Sergei, Tamara, Uliana, Fiodor, Hariton, Tsentr, Chelovek,
Shura, Schuka, Tviordiy Znak, Znak (for Miagkiy Znak), Eduard,
Yuri, Yakov.

No entry for bI or e".

I'm not exactly sure of the status of this alphabet. I gather
that people often devise alphabets of their own for use over
the phone.

857. A strange thing that happens when you are learning code

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 18:51:59 UTC
From: bruce@pixar.com
Message-ID: <1993Aug18.185159.9736@pixar.com>
Source record: 277690

Well, I've been practicing code for an hour or more every day for a month or two, and can now copy in my head at 17 WPM, after having vented my frustration to the entire net last week over being stuck at 13 WPM.

A few days ago, I was in my car and my radar detector started saying "T T TT T". I remember wondering why the manufacturer would have it say "T", and then I realized that it was simply beeping. I had a full-blown case of CW on the brain. I wonder if I am going to hear beeping sounds as letters from now on, whether I want to or not? It does seem that as soon as you develop this particular kind of insanity, you can copy faster!

Without joining the code/no-code argument for the moment, I have to admit that the rig and key are sitting right in front of me and I haven't had the motivation to make a single CW contact yet. My favorite mode is still packet.

Bruce Perens KD6OTD

I assume what you want is an antenna that responds to magnetic fields
only. (Radio antennas respond to electromagnetic fields.)

How about 3 small loop antennas mounted perpendicular to each other?
Detect the output of each loop separately and combine the voltages
(or currents) RMS fashion: V(total) = SQRT (V1^2 + V2^2 + V3^2).
That would give you the magnitude of the magnetic field, no matter
what its orientation.

How to do the RMS sum? Use a diode detector in its square-law region.
At low signal levels, any RF switching diode (connected as a detector)
puts out a DC voltage proportional to the square of the input RF voltage.
By summing the 3 outputs (from the 3 pickup loops), you get a signal
proportional to the square of the total magnetic field.

Dial cord is available from several sources: GC/Thorsen, Antique Electronic Supply, Radio Shack (shudder :-)) and others.

RS sells six feet of cord and three tension springs for 99 cents.
Their 1993 catalog lists it as 274-435.

URGENT??

Oh well, here goes... You'll need to take a test(s) to get your ham license. To prepare for the test, you'll need study materials. Those are commonly available in great quantities in your local retail Amateur Radio store in your local area.

Look in your telephone directory's yellow pages under 'Radio, Amateur, Supplies'.

Go into that local amateur radio store (ham radio store) and they will have a selection of books and audio tapes you can study and listen to. A recommended set of text books and tapes is made by Gordon West.

If you want to have VHF/UHF privileges only, (very difficult to talk outside of your local area), then go for the 'TECHNICIAN' class license. There is a minimal test on electronic/radio theory, and no need to learn the Morse code.

The next step up is the NOVICE class license, which has more limited VHF/UHF privileges than the Technician class license, but offers HF (lower) frequencies very suitable for communications around the world. You'll need to learn the Morse code, and be able to receive Morse code at a minimum of 5 words per minute. Though most of your HF privileges require morse code communications only, there is one ham band (10 meter) where you have limited voice and data/packet privileges.

The next step is the TECHNICIAN PLUS, or simply the Technician License where you have also passed the 5 word per minute Morse Code reception test. Or, you may have achieved this by having the Novice license first, and then took the Technician License written test. Anyway, the TECHNICIAN PLUS license has all the privileges of the Technician (full VHF/UHF), as well as

the HF privileges of the Novice. This is a good all around beginners license if you can learn the Morse code.

The next step up is the GENERAL class license, with Advanced and Extra class licenses being more difficult to achieve than the General class but having slightly more HF band privileges than the General. The General class license has a much more demanding written test covering more electronic/radio theory, amateur radio regulations, and you must be able to receive Morse code at a minimum of 13 words per minute. These classes of licenses are more difficult to acheive than Novice or Technician, but give you more or less all amateur bands and privileges. Full HF/VHF/UHF.

The largest US amateur radio organization is the ARRL, or Amateur Radio Relay League. They are the most well known, if not always the most well liked organization (I like them, many don't). ARRL also has complete texts, study manuals, and morse code tapes to learn from. I still recommend Gordon West's study materials and tapes personally, I used his and many others and enjoyed Gordon West's style of teaching the most.

Your best bet is to find your local amateur radio store, talk with them, and/or buy several amateur radio magazines and read the ads for learning materials. These magazines include 'CQ', '73', 'QST', and 'Radio Fun'.

Have fun!

Try the ARRL publication "FM & repeaters". Don't know how well they've been
updating it recently but in the past it's been way out of date. However, there
were instructions in the 1980 printing on how to build one, & duplexer
technology doesn't change much over the years. In what way do you want to
"maintain" your duplexers? Once they are tuned they generally don't require any
tinkering.

868. Help!...RF Everywhere!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-18 21:05:00 UTC
From: depaul@spk.hp.com
Message-ID: <CBz3wD.AD3@spk.hp.com>
Source record: 277695

Hello.

I wonder if anyone on the net can help me with my RF problem...

Background

I'm using a TS440 hooked up to a coax air balun (18 feet of RG58U single layer wound) which feeds a balanced antenna tuner (a variable L on each leg of the 450 ohm prefab ladder line, with a variable capacitor across the output). The two antennas I use with this tuner are a vertical and a 560 foot loop. I'm using polyethylene tubing over the ladder line over the first 10 feet or so of both feeds to the two antennas. This tubing starts at the output of the tuner and insulates the feed from metal. The following problems occurred without the tubing also.

Here in Eastern WA we have (or at least I do) rocky soil.

Problem

When I get on 40 meters the rig TURNS OFF when I bring the power up to 100 watts. No other band at this point does this. This happens only for the vert. I've done a band-aid fix, which I don't want to keep, that is take all other plugs that are going into the same outlet and move them to another electrical outlet. The problem goes away.

On all bands I have another problem: when using my outboard speech processor at even a very light setting of 6 db, my voice is horribly distorted with tones, clicking, and no audio all together. On CW I get chirping from time to time. When I switch to a dummy load there are no problems. These problems happen on both antennas.

Please help me on this...This is driving me nuts.

Thank you,

Marc DePaul

> I would like to learn more about duplexers and how to maintain and
>"configure" them. Any suggestions on where I might look for some good
>information.

If you can find the "FM and Repeater Handbook" by Ken Sessions K6MVH,
(out of print, but probably to be found in a big library)
there is a pretty good section on duplexers there. There is also some
information in the ARRL repeater handbook.

Also, call the various duplexer manufacturers and ask their customer
service people if you could have a copy of the tuning instructions for
their product. Many of these are actually a good introduction to the
way the duplexer works.

In general, assuming that the coupling cables between cavities aren't
missing, tuning will only require a good quality signal (a one-watt
walkie works fine for me), a dummy load, and a receiver with a usable
S-meter.

If the duplexer is a pass-notch type, you have to peak all the pass
cavities, then null the notches. You repeat this several times.
Typically the pass tuning is the one in the center of the bottle; the
notch is the slug off to the side or the sliders on the side.

Notch-only duplexers are simpler: you just null all the notches.

60 db isolation is minimum; I regularly see 70 to 90 db after several
rounds of tweaking the bottles.

Have fun!
- Brian

This similar to, but not identical with the BRAVO pager you get with 3 mos.
of free service for 49 bux at the corner cell phone emporium.

This unit has no display, minimal housing, and has the 68HC11 re-coded to
dump the data portion of POCSAG messages that are addressed to it to a
serial data port (POCSAG = British Post Office Code Standardization
Advisory Committee, also known as CCIR code something or other). It's
handy for controlling remote devices via an existing paging system.

Um, er there is the neat antenna used on satelites prone to tumbling
that has pretty good omni characteristics.. even so far as polarization
too! It is called something like a QuadraFilar Helical Mumble or
some such... Gack, where is my ARRL Antenna Handbook...

It looks kind of like someone took an egg beater and twisted it
so that the 4 sides (hoops?) were spiraled by about 1/2 turn.
Really geeky, but supposedly helps to avoid fading from a
rotating tumbling satelite vs a fixed polarization ground antenna...

If you can't find a copy of the ARRL Antenna Handbook, I'll get
more data from my copy at home.

I once owned a car with an FM stereo receiver that used
diversity reception. The car had two antennas: one normal
vertically polarized cowl mount. The other was a horizontally
polarized wire antenna embedded in the rear window. The stereo
would sample both antennas and switch to whichever had the best
signal. I had almost no problem with "mobile flutter".

It would sometimes get confused when I transmitted on 2m and
start switching at a fast rate causing a loud squeal to come
from the speakers.

PSE SEND US A MSG TO GIVE US AN IDEA OF HOW MANY STATIONS COPY
OUR NEWS BROADCAST...

SUBMITTED BY COL VK2CTD.

Information on "call-ins/call-backs" to 20/80m broadcasts.

During the last four years in excess of 220 stations have responded to the 20/80 casts by calling in before, or giving call-backs after the 'casts.

Despite band conditions being at their lowest since early 1987, at which time these records were first kept by VK2BQS, the number of callers still holds up, with 27 on 20m and 8 on 80m for the period 1/4/93-8/8/93.

For your interest the stations which have called in the last 4 months (several of them weekly) are listed hereunder.

20 metres.

Western Australian News

WAADCA AUGUST GENERAL MEETING

4th August saw the club's general meeting with a good attendance from members and visitors. Joe VK6ZTN, the club's technical officer reported that the data link between Perth and Sydney is very close to coming back on line, this time through the enthusiastic efforts of a number of amateurs at both ends of the system. The link is planned to have a data capacity of 4800bps. Initially a 1200bps ROSE link will be established and as soon as possible afterwards, a 1200bps NETROM link. This will enable some interesting side-by-side performance comparisons between the two modes.

CLUB NEWSLETTER

Phil VK6ADF and Bruce VK6ABR did another excellent job with the club's August newsletter. For some time they have been able to incorporate CAD drawings into the newsletter, but now they have managed to incorporate photographs with Bruce's new video-blaster system. The newsletter contained a couple of pictures of better quality than we have ever been able to achieve by other methods.

You can contact WAADCA by sending a packet message to the Secretary, Trish VK6QL at VK6BBS, or myself or by writing to PO Box 425 Cannington WA 6107.

That's all for this week.
73 from Phil VK6AD
President

IPS weekly report

---

6 August - 12 August 1993
Issue no.: 33
Date of issue: 13 August 1993

Date 06 07 08 09 10 11 12
10cm 94 91 91 96 102 108 101
A 19 18 09 15 07 04 (05 estimated)

T 51 41 45 47 39 50 55

Summary of activity

Solar activity was very low 6th-9th August, low 10th and 12th, and moderate on 11th. There was an M1 flare on 11th.

The geomagnetic field at Learmonth (WA) was at active to minor storm levels 0900-1500 UT on 6th, otherwise mostly quiet with some unsettled periods for the remainder of the week.

Ionospheric F2 critical frequencies at Sydney were mostly near predicted values except for brief depressed periods on 7th and 10th. There was some sporadic E blanketing on 7th and 10th August.

Forecast for the next week (13 - 19 August)

Solar : Low - moderate, chance of isolated low level M class solar flares

Geomagnetic: Quiet until 16-17th, when active periods are expected (coronal hole). Conditions should return to quiet - unsettled levels for 18th and 19th.

Ionospheric: Generally good conditions apart from degradations expected during interval 16-17, (especially during local night).

: No idea if it would work in the US though.

: Dave

Although there are similar laws in the U.S., virtually every written warranty
has a disclaimer about "no other warranties, expressed or implied" that will
supercede anything the salesclown tells you (unless you can get it from him
in writing).

I would like to purchase a used Tek 485 within the next week. A couple places advertising in Nuts & Volts Magazine have them listed for $950, which seems like a pretty good price (especially compared to Tucker). Has anyone out there done business with either of these outfits:

Electronics Brokers, Boulder CO
Western Test Systems, Broomfield CO

If so, please drop me a line and let me know whether they delivered satisfactory equipment & service.

Any suggestions for possible alternate suppliers would be appreciated, too.

Without joining the code/no-code argument either, I did find an actual commercial use for morse a little while ago. We have several UPSes for some of our crucial network equipment, and I made the mistake of plugging another router into one which was already full up. It immediately began beeping in a curious pattern, which according to the convenient chart on the back of the manual was the letter D. This means 'Limited run time remaining' so I unplugged the new router ;) The manufacturer used all the alphabet and some of the punctuation for the different error and diagnostic codes.

BTW, I do not know morse, so it's a good thing the manual was laying around. Somehow I doubt anyone would spend the time to learn code so they could understand their UPS, but it is interesting that the chart had both the dits and dahs *and* the letters...

When I got my Extra I practiced the code like this...
After I could copy 50% of the simulated test that Morse Man sent me on my computer I'd kick the speed up 5wpm and work on it again just the simulated tests...I kept repeating the process until I could copy 50% at 50wpm. The test seemed to be at 5wpm....(I didn't even bother to listen to 20wpm code when I was working on my code) Don't know if the technique is used by anyone else but it worked for me as I was able to get 9/10 fill in the blanks and had a min. solid copy too.
(BTW i printed my letters)
Just this hams $.02

I have just done something very stupid. My HT got some water in it, so I decided to open it up and let it dry out, and clean up any residue. This should have been a relatively simple task, except that I broke the connections to a very important part that was attached to the aluminum back of the HT. I believe this was the power amp. I tried to see if this was fixable, and have really screwed things up. Could someone please tell me which is the best place to send my HT to for repairs? Please -- no flames, I feel stupid enough as it is.

Questions - Does this unit support the newer 1200 bps POCSAG? Is anyone (like MOtorola for example) using Golay Sequential Code (GSC) any more? And it's CCIr Radio Paging Code Number One. And what a fight they (the BPO and Philips / Pye) had with Motorola at the CCIR.....

Cheers / Mark Fraser

890. FCC Collins 851S-1 and 851S-2 receivers

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-19 05:50:41 UTC
From: die@pig.UUCP
Message-ID: <1203@pig.UUCP>
Source record: 277664
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.amateur.equipment,rec.radio.swap

The unit

I recently acquired a FCC surplus Collins 851S-1 receiver once used by the FCC in Florida from an ad in the local want ad paper. It is a 19 inch rack mounted fully synthesized 15 khz to 30 mhz HF CW/SSB/AM receiver tunable in 1 hz steps that was built in 1981. Frequency display is on orange LED digits with adaptive variable rate tuning via a large spinner knob. The unit has a synthesized BFO offsetable in 1 hz steps from 0 to 9999 hz (the offset is displayed in LEDs), and has a built in speaker as well as the usual headphone and 600 ohm line outputs.

As the FCC bought them, they seem to have 6 khz, 3 khz, 1 khz 500 hz and 200 hz symetrical mechanical filters, and 2.4 khz USB and LSB filters. The unit will support ISB operation, but may not have the card installed. The FCC version seems to use half octave RF front end filters.

The unit has a black front panel with the displays and LED mode indicators under smoked plexiglass. There is an incandescent lamp illuminated S/audio level meter on the the left hand side with standard ham S units and dbuv scales. The tuning knob is on the right.

The receiver can be computer controlled, but unfortunately the FCC seems not to have installed that option in my unit. Control is via a serial port.

The synthesizer is a decade mix and divide design typical of early 70's pre-variable radix IC synthesizers. Collins qoutes 2 ms settling time and seems to have included provisions for frequency hopping at a 100 hz or so rate via the serial port. Lord know what kind of phase noise it has, but some similar designs (eg Fluke) from that era were pretty respectable. The receiver conversion scheme is up from HF to 109 mhz first IF and then a 9 mhz second IF and 450 khz third IF.

The questions

1. Is anyone familiar with these radios ? How many were made and who used them ? The spooks (NSA and associated military security services) seem to have been using Racal HF receivers in this era; some of those radios are beginning to show in surplus. So who used the Collins units (obviously at least one was used by the FCC) ?

2. How long did the FCC use them ? and for what ?

3. Is there someone out there who has used one ? How did they compare in performance to the Racals ? What are their strengths and

weaknesses ? The Racal units seem to be a much more modern design
(allege to use DDS for example), why did Collins lag behind with such
an old design ?

4. Does anyone know of sources of the remote control boards ?

5. Where does one get spare parts ?

6. Are there collectors who are interested in these radios ?
Have others appeared in surplus ? Are they worth keeping or just
selling to a Collins collector ?

It sounds to me as if you are having massive r.f. feedback into your
shack. The first thing you should look at is your grounding system.
All your equipment chassis should be tied to a common point; then that
common point should be attached to an earth ground through MORE THAN
ONE ground lead. The point is that any single lead from your common

shack ground to the outside stake (or whatever) is an odd number of wavelengths at SOME frequency. If that frequency happens to be in or near one of the ham bands, you have no ground at all when operating on that band.

Measure your ground lead - is it near a quarter wave at 40 meters? Even if it isn't, run another in parallel with the existing one and make sure it is a different length. And make sure the ground stake is deep enough to be effective. DON'T use any stake or other connection used by your power or telephone wiring; those are too apt to introduce ground loops. The same may be true of water pipes.

Eliminating r.f. feedback is tricky; there can be, and probably are, several sources you will have to find and eliminate. But a reliable ground is a must, and will give you a good start.

73 and good luck, Van - W8UOF

Hello,

I have read a few postings about the C558A HT of Standard, and was
wondering what are the differences between the C558, C558A, C558S and
C550.
I own a C558S and was told that this was the European version with
software limited reception and hardware limited transmitting
capabilities. I have modified the software so I think it now comes
close to a full C558, esp. since it did say C558S only on the package.
The transceiver itself does not show an 'S' on the label. The C550
seems to be another limited version, but I'm not sure. So what is the
C558A?

hope someone can help me,
Bernd

I was in a store talking to fellow ham and for some reason I almost subconsiously kept hearing code. I knew I was hearing it and automaticly was trying to decode it. I told him that I was hearing really faint CW and he said he had his HT turned really low and that was what I was hearing was the repeater IDing in CW. I literally could not really hear it but my mind after a couple of years of doing CW was trying to decode those faint signals without me being really aware of it. Kinda a strange feeling. 8-) 73!

I too am working on 20 WPM and have started to hear this phenomena. However, there are places to hear code on commercial radio, usually as a musical backdrop. For example on our Local AM Newsradio, the news summaries are preceeded with "r /" (it has a nice rythm ._. _.._.). I had been listening tho these things for a year and not recognized it until recently. The recent post about the UPS warning beeps is another place where Morse is used. Fortunately, I haven't passed into the speed range where brain damage is known to occur ;^)

>
Well, that's not quite my situation......the possibility is relocation for work. It'll probably be somewhat permanent.....of course when they say permanent work, it usually isn't *permanent* 8-)

And, how does dual citizenship fit in here?

Well, since Canadians don't have to have a permit, their licenses are good in the US so long as they keep them current. So length isn't any problem at all for them. (Others merely have to reapply each year.)

Dual Citizenship is a BIG problem. If you're dual US-Canadian, then it follows immediately that you're a US citizen, and #2 above voids your Canadian license in the US. You would then need an FCC license. Study up, wiggle a US address somewhere, and get tested as soon as possible (you can probably find a session in Vancouver, I would think- 3 Volunteer Examiners can give US license exams anywhere), because you won't be able to transmit in the US legally until your US license comes in the mail, an 8-12 week wait from testing. And forget all that Extra stuff; your license class will determine your privileges.

If you're Canadian-AnywhereElse, you're Canadian license is good, and near as I can tell, so is your AnywhereElse license, but you'd need a permit for the latter.

Not to suggest that it would be a good idea to call the FCC to find out about
your new call, but it would be nice to know what my new call is going to be.
Even though I couldn't be a station operator, I could transmit if another ham
was there to be the station operator. I know that I could do that 'third
party' any time he's there, but that would be under his call. I guess I just
want *my* call...as a matter of principal. (sp?)

Cheers,
David

I just received a new AEA catalog in the mail and saw the new IT-1 Automatic Tuner for the IsoLoop 10-30. Since AES has this is stock already ($259.95), I guess it's probably not *that* new and I was asleep at the switch on this one.

Anyway, for that price I figured I better check it out first. Anyone on the net use this thing and have any comments? I was wondering if it really tunes it right in for you, or whether it just lets you pre-set 8 memories. Also, that large thumbwheel knob looks interesting, but does it account for the 'play' in the mechanics?

I don't get any DX on this loop, so I think $250's going to be hard to justify.

Thanks folks,
Gene

904. Report on the ATS-606

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-19 15:19:26 UTC
From: 8919157y@levels.unisa.edu.au
Message-ID: <1993Aug19.091926.20884@levels.unisa.edu.au>
Source record: 277718

Hello from down under,

I am posting for a friend of mine (Peter) who's a radio buff here in Australia.

He has a report on the ATS-808 which is a portable 45 memory shortwave receiver produced by SANGEAN. It is my understanding that this is considered a top of the range product in the shortwave community. His request is for a comparison of the ATS-808 with the new product (1993) from SANGEON the ATS-606; also a report on what ever you might know about the ATS-606. The ATS-606 is a physically smaller (ie. compact) receiver which retails for less than the ATS-808 in Australia. Why? Is this the same case where you are? The ATS-606 is also sold by Siemens as the RK-659, if that helps.

Also would anybody know the price of the ATS-606 unit in Singapore? Or maybe the price of the unit from your local retailer? Your assistance would be of great value to Peter. Below I have included the features for the ATS-606 found in our local 1993 Dick Smith catalogue.

The ATS-606 Features: ATS-606 Frequency Ranges:
1). Automatic tuning system 1). FM 87.50 - 108 MHz
2). 45 station memories 2). LW 153 - 513 kHz
3). Comprehensive LCD screen 3). MW 522 - 1710 kHz
4). Scan tuning & direct keypad tuning 4). SW 1.715 - 29.995 MHz
5). Dual alarm clocks
6). Dual time setting
7). Adjustable sleep timer
8). Soft carry case

Thanx
Mark
(19th August 1993)

In article <1993Aug17.015547.26921@bnr.ca> markus@pinetree.org writes:
>I am wondering about 'Diversity operation'. My shortwave receiver has an
>allusion to it in the manual; it involves tying the final IF of two receivers
>together and tuning them both to the same station. My guess is that two
>physically separated antennas are involved and the intended benefit is to
>reduce selective carrier fading.

Diversity reception is a technique to take advantage of the fact
the many kinds of radio fading are due to interference (Ralliagh fading
- interference in the physics sense of the word) between signals
traveling slightly different paths from the transmit antenna to the
receiver antenna. This results in an rf field that has local maximums
where the waves add in phase and local minimums where they cancel. In
the case of both skywave propagation and many kinds of microwave
atomospheric propagation changes in the medium (the ionosphere or even
the lower atmosphere in the case of tropo propagation) cause one or
more of the radio paths to change slightly in delay or amplitude
which causes the locations of the minimums and maximums to shift with time.

This shifting of the wave paths causes the signal as observed at
one point in the wave pattern (the receive antenna) to vary in amplitude
as the multiple paths change from adding to cancelling at that point.
This causes fading. When the path differences are great enough
(milliseconds - typical of HF propagation) this cancellation may take
place only at one frequency and signals at nearby frequencies may have
enough different phase to add. This causes selective fading where
signals at one frequency fade differently than those at nearby frequencies
(such as the carrier of an AM signal fading when the sidebands don't
or the mark signal of a fsk transmission fading when the space signal
doesn't).

Some clever fellow discovered many many years ago that for HF
signals which are often propagated by several paths (multiple layers or
pockets of ionization in the ionosphere) the rf field is complex enough
so signals observed at rather closely spaced points (less than a few
wavelengths apart) often fade quite independantly of each other. This
lead to the notion of space diversity reception, where signals from
multiple receivers fed from antennas spaced a few wavelength or so apart
are combined in some kind of post detection combining circuit which
gives greater weight to the stronger signal. Some such combiners
(widely used on VHF/UHF fm repeaters to handle multipath flutter fading
from mobile users) simply switch to the receiver providing the stronger
signal at the instant, others combine in proportion to the square of the
ratio of the signal strengths.

The whole notion is that when one receiver sees a fade the other(s) will often not be seeing a fade and will still be providing good signal. By selecting s receiver with a good signal, a nearly continous feed of the information is possible even if each receiver is seeing good data only intermittantly.

A common configuration for space diversity at HF is for two identical receivers tuned to the same frequency but fed from different antennas to be cross connected so the AGC voltage of both receivers is controlled by the receiver getting the stronger signal. Outputs are combined in some kind of diversity combiner (often part of an rtty terminal unit or modem). Many sophisticated HF receivers intended for military or commercial use include provisions for such AGC cross strapping.

It is important to note that the information is combined *after* detection. It is not sufficient to merely connect two antennas together or even the IF of two receivers together, because the carrier waves present will combine in the same way signals at an antenna do - they will interfere with each other and add or cancel depending on relative phase. This is equivalent to what happens at the antenna with signals from different paths (principle of superposition) and simply produces the same kind of fading as seen at the antennas (sometimes worse). In the case of RTTY, this means that effective space diversity operation requires two separate audio filters and detectors with combining taking place at the DC outputs of the detectors.

It is also possible to send the same information on multiple frequencies and combine receivers tuned to all of them (so called frequency diversity which does not require separate antennas), and also combine receivers with antennas having different polarizations (often used at HF and on microwave links).

> Anyone care to reminisce about practical use of this technique? Is it still
>used or has it been obsoleted by SSB?
>

What you are talking about is called space diversity (or maybe polarization diversity if the antennas are not parallel). Yes it is widely used, particularly for reception of rtty/data signals on HF. Most larger Navy ships make extensive use of space diversity with multiple receive whips located fore and aft feeding radios tuned to the same rtty signals.

And in the era (now long gone by) of extensive use of HF rtty to transmit information to and from fixed stations most installations had multiple antennas and receivers so diversity could be used. Both two and four way diversity was common.

Troposcatter systems almost always use extensive diversity reception gear with simultanious polarization, frequency and space diversity often being used on the same link. Multiway combiners used are often at least four or even 16 way.

And as I mentioned early many VHF/UHF repeaters use the
technique to reduce the impact of flutter fading from moving mobiles.
There are even some very fancy high end car FM radios that have
two antennas and use diversity to reduce the impact of multipath fading
on fm stereo reception.

And lots of ordinary microwave links (which are subject to
fading from various tropospheric propagation effects) use space
diversity with multiple receivers and antennas (look at a microwave
tower and notice that many have two or more identical dishes pointed in
exactly the same direction which often indicates diversity is in use).

So in answer to your question, no, diversity has not been made
obselete for HF by SSB. It is most often used with data signals
and is not often used with SSB voice (because of the phasing problems
I mentioned earlier), but in general diversity is alive and well.

Wait till you start tapping your fingers in code while you are reading, or
listening to something.... Not only that, but when you are watching a movie
or television and hear code-like sounds, it'll drive you crazy!!!!

Yes, Mange, I CAN do code....

Sorry that should be 851S-2. The radio is a 851S-2, the manuals
I have are for an 851S-1. The difference seems to be that the S-2
tunes in 1 hz steps.

>I'm planning on getting a Kenwood 732 dual band mobile, but wasn't sure if I should get a dual band antenna and a duplexer or just get two antennas. Any suggestions? What do I look for in a duplexer?

I looked into this when I got my TM-621 (through .swap) and decided against spending $60-$80 for the attenuator. I drilled two holes in the car instead and installed NMO mounts on which I currently run Larsen black 1/4 wave verticals. Works good and I still have the flexibility to try different antennas.
Anybody want to sell me another Kenwood TM-621 or 631?

Wait till you start hearing cw in a quiet room! Even worse, wait till you start hearing cw in your sleep! I've been there...and when I first started noticing it, people also told me that it was very normal (well, as normal as we Hams can be). :-)

A while back I sat down in a co-workers office to talk and was suddenly distracted by the activity light on the cassette tape drive.

I focused on it and then realized that, yes, it was sending dit dit dit dah dah dah dit dit dit over and over again.

We investigated and true to the message, the tape drive did not work.

After power cycling the machine, the CW message went away, never to be seen again. The tape drive did have to be replaced though.

I haven't found any mention of this error mode in any of the documentation for this drive. So who is the wise guy that put this message into the tape drive and didn't tell anybody about it?

>someone please tell me which is the best place to send my HT to for
>repairs?

ICOM runs a major repair facility in Alabama, and their US HQ offices are in Bellevue, Washington. Call 'em and they'll get you squared away quick. I've always had great experience with ICOM factory service. (For example, when the final module blew in my IC-2GAT hand-held rig--because a cheapo power supply running unattended packet decided to switch itself from 12 to 24 volts--I had a local dealer send the rig to ICOM in Alabama. It came back in about a week with shiny new final module and several other "tweaks." They even threw on a new rubber thingie that covers the external mike jacks [mine had flopped off long ago].)

>Please, no flames, I feel stupid enough as it is.

Funny: I do, too. And I didn't even mess up a radio (lately)!

GL, OM!

PS Speaking of ICOM, if anyone is interested, my private, personal opinion is that the ICOM IC-2GAT is THE killer single-band 2-meter hand-held transceiver. Built like a brick, cranks out more than 8.25 watts when fed a diet of 13.8 Vdc, sounds great and has just enough features to make it convenient but not annoyingly complicated. Just my opinion (I reviewed the sucker in Jun '90 QST, p 37).

Message-ID: <19AUG199312364409@zeus.tamu.edu>
Source record: 277638

Howdy, here's another newbie question:

I just passed by tech no-code, and want a 2 meter HT. Should I get a dual-band (economy minded graduate student) or just a single. I guess the real question is 'is there and practical advantage for two bands when i start or no'?

I'm looking towards an alinco fj-180 2m or a fj-580 dual band. (new)

I know of a used icom IC-u2AT with batt and quickcharger for $150. Good deal???

I would like an s-meter for hunts and one that is rugged for lots of outdoor use.

Thanks for your advice!!!

917. TR 18 rotator?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-19 17:58:54 UTC
From: rps@cray.com
Message-ID: <1993Aug19.125854.17402@walter.cray.com>
Source record: 277643
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc

Looking for information.

Did CDE ever make a TR 18 rotator?

I picked up the old rotator without a control box, It looks much like a a hy-gain CD-45. I heard that CDE (the rotator company Hy-gain purchased) made a TR-20 sometime ago. I'm sure this is a pretty old rotator and most likely this one is older than the TR-20's. I opened this thing up and it is in perfect condition. It has 8 wires much like the CD45's and the HAM, and tailtwiter rotators. The Gears are in perfect shape, and the only Identification it has is in on the ring gear "TR 18". It's a bell shape rotator and seems to hold up well, It sat up on a tower for about 20 years.

It doesn't have a huge break on it however (A bump on the bottom, like the HAM and T2X rotators). I plan on using if to rotate UHF/VHF beams so I don't think having a small break will be a problem.

Thanks!

Dear Abhijit,

I would be glad to send you information on getting started in Amateur Radio.

The American Radio Relay League distributes a free package to prospective hams. The materials include a booklet entitled: "You're Invited...Getting Started In Amateur Radio," and a list of your local ham radio clubs, instructors, and upcoming test sites.

Please e-mail your postal address to me, and I'll see that a package gets sent to you. Or, call 1-800-32 NEW HAM (800-326-3942), and ask that the free information package be sent to you.

Good luck and welcome aboard, Abhijit!

Sincerely and 73,

>Questions - Does this unit support the newer 1200 bps POCSAG? Is anyone
>(like MOtorola for example) using Golay Sequential Code (GSC) any more?.....

The unit supports both 512 bps and 1200 bps. I am told that it also will
support 2400 bps. The paging channel bit rate is changed by re-programming the
68HC11's internal EEPROM using the serial port and a PC.

To the best of my knowledge, Motorola is selling POCSAG units only. They
acknowledged that a GSC unit was a possibility, but would not give any dates.
(My last contact with Motorola on this was about a year ago.)

The 02AT final is the big IC connected the back of the 02AT with one machine screw and a lot of thermal grease. All those little parts on the 02AT are pretty tough for my Weller soldering iron to reach - I'd send it to ICOM.

The other place that tends to break is the connection from the BNC center pin to the PC board. You might want to check that. I finally solved the problem with some wire between the BNC and PCB.

: PS Speaking of ICOM, if anyone is interested, my private, personal opinion
: is that the ICOM IC-2GAT is THE killer single-band 2-meter hand-held
: transceiver.

I have three friends that are flaming 2GAT bigots for many of the reasons Brian mentions. I don't own one, but the Human Interface is really nice. If you homebrew 6 1000AE cells into the BP4, you get something that fits in your hand but can transmit all day. One of the guys is on his second external plastic after dropping it off a moving bicycle. Tough radio.

How will the FCC know how absolutely disgusted everyone is with their third world handling of licenses if no one calls them. They probably think that they are doing a good job (they are part of the government after all).

933. Connectors? UHF NMO N PL-259/SO-239 ...

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-19 21:33:51 UTC
From: chen.roch817@xerox.com
Message-ID: <1993Aug19.213351.6269@spectrum.xerox.com>
Source record: 277667

I recently thought of reusing my old cb mag mount and buying a nice VHF or UHF antenna for it, but I'm not sure of the type of connector it is. It looks like a cross between a PL-259 and a SO-239. It has threads on the outside, but there's also a pin in the center of the connector. Is this a standard connector/mounting?

Can someone also briefly describe what a UHF, NMO, and N type connector look like?

Thanks!
Dan N2PKE

>Not to suggest that it would be a good idea to call the FCC to find out about
>your new call, but it would be nice to know what my new call is going to be.
>Even though I couldn't be a station operator, I could transmit if another ham
>was there to be the station operator. I know that I could do that 'third
>party' any time he's there, but that would be under his call. I guess I just
>want *my* call...as a matter of principal. (sp?)

>Cheers,
>David

Even if you KNEW what the call was, until it is mailed to you,
received by you, and signed by you, it is not a valid license. You
could not use the call, even with a control op present. You would
still have to use his callsign.

On a different slant... Isn't there something in the mill about
electronic filing?? Perhaps notification could be electronic
also...someday.

Cheers (and beers),

937. HELP WANTED: TH-78A, W21AT, or F-530 dual bander?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-19 22:43:11 UTC
From: jhong@fnma.com
Message-ID: <1993Aug19.224311.21714@almserv.uucp>
Source record: 277658

Dear netter,

I am new to the radio world and plan to buy a hand held dual bander. My questions are:

1) For hand held radio, is the 144/440 dual band radio is the best way to go? Currently, I have two 40-channel walkie-talkies. This type of radio normally is huge (compare to dual band) and can not go very far.

2) How far does a hand held dual bander transmit without a repeater or extra configuration? A walkie-talkie goes less than a mile. If a car antenna is provided, it goes less than three miles.

3) Comparing Kenwood TH-78A, icom W21AT, and Yasue F-530 dual banders, which one is the best (in terms of range, function, newer technology, price/performance, expendability)? Or, will you suggest anything else (e.g. single band)?

4) Where can I get a cheap dual bander (144/440)? Is there a used ham market place?

Thanks in advance.

- Joseph

B DX @ ARL $ARLC AE70
QST de W1AW DX Bulletin 44 ARLD044 From ARRL Headquarters
Newington CT August 20, 1993 To all radio amateurs

MELLISH REEF. During the three to four day trip aboard
te schooner Ninato the
reef, DXpedition operators will be active as VK4CRR/MM on
7180 and 14195 kHz. Ativity from the19 to 28. Thanks VK4CRR, WA4DAN,
W5KNE and QRZ
DX.

MOUNT ATHOS. JA3MNP and SV2WT are now active. SV2BES was
heard on 18120 kHz at 1955z. Thanks W2MIG, K4CEF, N4VZ,
KI5GF, W5KNE and QRZ DX.

LIBYA. The now not-so-recent five day activation of Libya
by Romeo, EK0RR; Danny, LZ2UU; and Said, 5A0RR; netted
some 11,000 QSOs. Copies of the log are in Bulgaria and
QSLs are being sent. Said, a Libyan national, will
continue to operate as 5A0RR. The call sign is in effect
for two years. Said is primarily a CW op but may operate
SSB from time to time. Thanks W1GG, WB2DHY and NT2X.

SAINT PAUL ISLAND. Yet another DXpedition is planned,
this time for the first week of September by VE3MRN,
VE3VQL and VE3CRG. The group will operate from the north
island using the call sign CY9R. Thanks VE3VQL, W5KNE and
QRZ DX.

CALL SIGN CONFUSION. The XE0 prefix is being issued to
Novice licensees in Mexico. Their operating segments on
HF are 7000 to 7050 kHz CW and 7050 to 7100 kHz LSB.
Thanks XE1MD, W5KNE and QRZ DX.

ERITREA. The DX Advisory Committee, DXAC, vote on the
DXCC status of Eritrea is scheduled for August 30. If you
have an opinion one way or the other on this matter,
contact your DXAC representative.

TOP TEN LIST. The ARRL DXCC Desk has developed a ''need
list'' based upon actual counts of countries credited to
DXCC Awards. From the most wanted, they are Peter One
Island, Yemen, Bhutan, Heard Island, Libya, Bangladesh,
Tromelin Island, the Andaman and Nicobar Island groups,
Glorioso and the Penguin Islands. For more information on

this list, check the How's DX column in September QST.

THIS WEEKEND ON THE RADIO. The seventh ARRL 10 GHz Cumulative Contest will be held from 8am to 8pm local time this Saturday and Sunday, and the weekend of September 18 and 19. See page 113 of June QST for more information.

Contest Corral on page 110 of July QST details the following activities for the weekend.

TheSEANET Phone Coarts at
0000z August 21. Exchange signal report and serial number, starting with 001 on each band.

The phone weekend of the North American QSO Party, sponsored by the National Contest Journal, will be from 1800z Saturday through 0600z Sunday. The exchange is operator name and state/province/DXCC country, as appropriate.

The New Jersey QSO Party, runs from 2000z Saturday to 0700z Sunday. The exchange is signal report, serial number and NJ county/ARRL section/DXCC country, as appropriate.

There are three operating periods for the SARTG Worldwide RTTY Contest. They are from 0000 through 0800z and 1600z through 2400z August 21, and 0800z through 1600z on August 22. Limit operating to 80, 40, 20, 15 and 10 meters. Exchange RST and QSO number.
NNNN
/EX

[Followups directed to aus.radio; many foreign rigs are just not available in Australia.]

Well, don't stay with one band; get a dual-bander if you have the money. They're much more useful, and besides, 70cm needs the use!

Purchase from well-known suppliers, and make sure there is a reasonable warranty. One year is fine, but 90 days is silly. Beware of rigs that have wide-band coverage; they tend to hear all sorts of extra garbage. Personally, if I wanted a scanner, I'd buy one...

Check the range of accessories, if you want things like VOX, head-sets, speaker-mic's etc (as an active WICEN op, I need these). Check the battery capacity; it ought to be at least 600mA/h these days, and many suppliers offer a whopping 1A/h pack; stay clear of those silly 300mA/h packs, as they will not last long. An alkaline cell holder is also useful for if/when all your nicads are flat; then again, I take a couple of large gel-cells on exercises, and I *NEVER* use nicads on a real WICEN activation!

Is the rig easy to use? Don't be embarrassed by having to consult the manual (some idiots judge a rig by seeing if they can operate it by never referring to the manual; I can't see the point of that) but at least the controls ought to be easy to use.

See if it uses standard speaker and mic connectors; I frequently use accessories from other manufacturers on my stuff, as there is a de-facto standard: 2.5mm mic/PTT and 3.5mm spkr, with the PTT triggered by the "leaky mic" technique of about 2.2k to 3.3k ohms. Some Alinco rigs have a tiny "stereo" type socket that's damned difficult to find, and some Kenwoods use speaker ground to trigger the PTT. A provision for external power is also nice, especially if it's OK to use 12 volts.

You'll want to get involved in packet radio some time; make sure the rig has a way of disabling the battery saver, otherwise you'll miss the start of the frames! A hi/lo power setting is also useful.

Ask around, see what others are using, and why; I use a Yaesu FT-470 dual-bander, mostly because I liked the way you drive it (other manufacturers have what I consider to be an arcane way of bringing up the various functions), and my existing investment in Yaesu stuff. That, and the agent is in every large town...

Decide what you want; a basic no-frills rig with no memories (plenty of 2nd-hand IC-2A's going around, for example) for $150-$200, or one with memories (including dialling), DTMF, CTCSS etc for a lot more.

: Forgive the wild hare nature of this...

: Has anyone ever linked multiple ham transmitter sites together so that
: they form a phased array antenna? I'm talking about sites
: significantly far apart -- say as much as a mile.

Sure you could do it, but the antenna pattern is all "sidelobes" unless
you have a carefully designed layout of transmitting antennas. The
angular spacing (radians) of the lobes is wavelength/baseline (give or take
factors of 2) if you only have one baseline. You have to add up many
different length baselines to cancel out all response except the desired
single lobe.

...

: This idea occurred to me after looking at some military phased array radars
: and I wonder if anyone ever did it at HF.
MHz range, at least. One of the first big telescopes was the Mills

Receiving arrays for radio astronomy have certainly done this down to the
20 MHz range, at least. The first big telescopes were linear arrays of
dipoles in the 80 - 400 MHz range.

Check out the Very Long Baseline Array (VLBA) which is to be dedicated
tomorrow in Socorro, NM. It "phases" 10 85-ft dishes spread out from
Hawaii to St Croix. (But to get decent antenna patterns on celestial
objects, you have to integrate over 12 hours to let earth rotation change
your effective baselines.) Effective beam size down to milli arc seconds.

945. Ham exams Part 1 of 3

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 02:31:16 UTC
From: marcbg@feenix.metronet.com
Message-ID: <CC1Do4.3uu@feenix.metronet.com>
Source record: 277674
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

AMATEUR RADIO EXAMINATION OPPORTUNITIES

Part 1 of 3

****

Special Note: Amateur Radio licenses usually arrive between 8 and
10 weeks after the test session. The FCC considers their
processing time to be 90 days--from the date they receive the
application. The FCC usually receives the application one
to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will not receive a new license from the FCC.
The existing Technician license plus the CSCE conveying the Morse
code test credit is the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming six to eight week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing
classes and/or Novice examiners in your area; please contact
the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on
recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to

MCI ID: 215-5052.

AFTER THE EXAM - HOW LONG WILL IT BE BEFORE MY LICENSE ARRIVES?

If you've recently passed your initial examination for an Amateur Radio license, or if you've just upgraded, please accept our warmest congratulations! Now that you've passed the test, receiving your license in the mail is the next step.
The FCCs current license processing time is at 90 days. In addition, there will be extra time required within the volunteer examiner system of two weeks or so allowing your VE Team and VEC (if for Technician class or higher) time to process your application, your license might not arrive for up to 12 to 14 weeks.
To keep your wait for that new license or upgrade as short as possible, we are taking the following steps to give you the fastest possible service.
We have begun providing our VE Teams with express OVERNIGHT mailers for the return of applications from ARRL/VEC exam sessions to us at the VEC--and we at the VEC have begun sending our daily packages to the FCCs Licensing Facility via an express OVERNIGHT service.
We are also encouraging our VEs, and imposing the same emphasis upon ourselves, to process examination packages as quickly as possible to expedite your license.
Having implemented the above procedures, the ARRL/VEC wants your wait for your new license to be as short as possible.
If you have any other suggestions about the program, or services we provide, please feel free to contact us.
You can help keep the processing time as short as possible by ALWAYS bringing all ORIGINAL CSCEs (plus copies of them) and your ORIGINAL FCC license (and a copy), plus your identification documents (photo-ID emphasized), to every test session you attend.

THINGS TO BRING TO THE EXAMINATION

Be prepared to bring the following items with you to VEC examinations: Your original current FCC-issued Amateur Radio license (and a copy of it)--if you are licensed; Any original Written or Code Element credit documents (CSCEs) which are currently valid; Two forms of identification (e.g., a photo-ID or drivers license and another item indicating your current name and address); A calculator (if necessary); A pen and two pencils; and, the applicable examination test fee ($5.60 for 1993 ARRL/VEC sessions).

TECHNICIAN CLASS GRANDFATHER CREDIT

If you hold a Technician class license which was issued prior to 3/21/87, you are not required to take the Element

3B (General class written) examination if you can provide a copy of your FCC-license dated before that date. If your licensed has since been renewed, and if you don't have a copy of the pre-3/21/87 license, you must seek a verification letter from the FCC. To do so, write to FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245 and request a Form 1010-B Verification Letter verifying that you were licensed as a Technician class prior to 3/21/87. After you receive that form from the FCC, bring it to the test session with you in order to claim your deserved credit.

LOST LICENSES

If you have lost your license, be aware that VECs are not permitted to submit any upgrades to the FCC without a copy of your current license attached to the 610 form. In order to expedite your upgrade, you must write the FCC and request a replacement license. Since that can take several weeks to arrive, we recommend that you also request a Form 1010-B verification letter from the FCC which will arrive in a couple of weeks--and is legally binding license document. You may use that form as a license until your Form-660 license arrives. The original and a copy of Form 1010-B must be brought to the test session verifying that you are currently licensed--the copy of which will be attached to your upgrade application (in lieu of an actual Form-660 license copy). To request the Form 1010-B Verification Letter, write to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you--also be sure to request that they send you a Form 1010-B Verification Letter verifying that you are licensed.

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a

sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If you will require accommodations, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are a severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. For information and applicable forms, send a SASE to the ARRL/VEC, 225 Main St, Newington CT 06111, and request our Handicapped Information Package.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC which is coordinating this examination. This single-character designator denotes the VEC as defined below. An "A" (for example) indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not find any examinations listed for your area, you may contact any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
The 1993 Test Fee is $5.60.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;
(d) 907-786-8121, (n) 907-243-2221 (or) 907-276-5121
(or) 907-274-5546

C = Central Alabama VEC, 1215 Dale Dr SE, Huntsville, AL 35801;
205-536-3904

N = Charlotte VEC, 227 Bennett Ln, Charlotte, NC 28213;
704-596-2168

D = Great Lakes ARC VEC Inc., PO Box 273, Glenview, IL 60025;
708-486-8019

E = Golden Empire ARS, PO Box 508, Chico, CA 95927; No phone.

G = Greater Los Angeles ARG, 9737 Noble Ave, Sepulveda, CA 91343;
818-892-2068, 805-822-1473.

J = Jefferson ARC, PO Box 73665, Metairie, LA 70033; No phone

K = Koolau ARC, 45-529 Nakuluai St, Kaneohe, HI 96744;
808-235-4132

L = Laurel ARC Inc., PO Box 3039, Laurel, MD 20709-0039;
(d) 301-572-5124, 301-317-7819, (n) 301-588-3924

M = The Milwaukee RAC Inc., 1737 N 116th St, Wauwatosa, WI 53226;
414-774-6999. Test fee for 1993 is $5.00.

H = Mountain ARC, PO Box 234, Cumberland, MD 21502; 304-289-3576

P = PHD ARA Inc., PO Box 11, Liberty, MO 64068; 816-781-7313

R = Sandarc-VEC, PO Box 2446, La Mesa, CA 92044; 619-465-3926

S = Sunnyvale VEC ARC, PO Box 60142, Sunnyvale, CA 94088-0142;
408-255-9000

T = Triad Emergency ARC, 3504 Stonehurst Pl, High Point, NC 27260;
919-841-7576

W = Western Carolinas ARS VEC, 5833 Clinton Hwy - Suite 203,
Knoxville, TN 37912-2545; 615-688-7771.
The 1993 Test Fee is $5.60.

5 = W5YI-VEC, PO Box 565101, Dallas, TX 75356-5101; 817-461-6443
The 1993 Test Fee is $5.60.

I STRONGLY suggest you meet Amateur Radio Operators in your area and get
to know them and the general 'scene' a LOT better.

>1) For hand held radio, is the 144/440 dual band radio is the best way to
>go? Currently, I have two 40-channel walkie-talkies. This type of radio
>normally is huge (compare to dual band) and can not go very far.

I'm assuming you mean a Citizens Band Radio? These radios are an amazing
example of regulatory idiocy. They operate on a completely innapropriate
band for their licensed modes of operation. In short, don't let ANY of
your experience with these radios serve as a basis of your understanding
of how VHF/UHF radios might operate.

In short, if your area supports it, 440 is a great area to operate, and
there are economies of scale in a dual band radio, as well as some nice
functionality. Dual band handhelds often can double well as scanners of
a sort too.

>2) How far does a hand held dual bander transmit without a repeater or
>extra configuration? A walkie-talkie goes less than a mile. If a car
>antenna is provided, it goes less than three miles.

There is no way to answer this question well since the radio is only one
small part of the forumula. Your location, height above average terrain,
antenna, weather conditions, etc... These all have a major impact in the
propogation of your RF energy.

However, I can have a fully quiet FM signal into repeaters located over
50 miles away provided there are no local obstructions like large buildings
and such. Simplex from a handheld to a mobile often ranges from 3 to 30 miles.

>3) Comparing Kenwood TH-78A, icom W21AT, and Yasue F-530 dual banders,
>which one is the best (in terms of range, function, newer technology,
>price/performance, expendability)? Or, will you suggest anything else
>(e.g. single band)?

Singe banders are nice solutions, cheaper than dual banders, smaller too.
Depends on your needs. The TH-78A is made by a stero manufacturer, and is
at least a generation behind the times I formerly owned a TH215A and TH75A),
the FT530 is nifty, but not as nice a radio as Icom's in general (I own one

of these now) Great remote control backlight LCD speaker Microphone though. the Icom seems to suffer from poor audio as a result of cramming too much into too little space, but should be the best *radio* of the bunch (I formerly owned a IC-W2A, incredible radio)

>4) Where can I get a cheap dual bander (144/440)? Is there a used ham
>market place?

This is what lead me to suggest you get involved with Amateur Radio Operators local to you. I take it you've never heard of HAMfests? These are the 'used ham market place' you speak of.

Best luck es 73!

jhong@fnma.com wrote:

>1) For hand held radio, is the 144/440 dual band radio is the best way to
>go?

That depends on a lot of things. Talk to some hams in your area and find out what bands are most commonly used. When I was looked, I asked around and was told that 2m and 440 were much more popular *here* than 220 and 1.2G, but that might not be true wherever you are. There may be nets or capabilities on one band that you want - for example, most of the organized activity here is on 2m, and many of my friends are on 440. If I had gotten a 220 radio, I would have been able to use the Condor net, but that was less important to me.

>Currently, I have two 40-channel walkie-talkies. This type of radio
>normally is huge (compare to dual band) and can not go very far.

It's probably not a good idea to compare amateur radio to CB.

>2) How far does a hand held dual bander transmit without a repeater or
>extra configuration? A walkie-talkie goes less than a mile. If a car
>antenna is provided, it goes less than three miles.

That depends on lots of things. I know people who have gone a few hundred miles, but that was in good conditions, and they were on mountain tops. Location makes a big difference. I can hit the San Francisco repeater from San Jose on my HT, a distance of about 50 miles. Again, ask people in your area.

>3) Comparing Kenwood TH-78A, icom W21AT, and Yasue F-530 dual banders,
>which one is the best (in terms of range, function, newer technology,
>price/performance, expendability)? Or, will you suggest anything else
>(e.g. single band)?

I suspect that it's more a matter of personal preference than anything else. Different people like different things. I bought the FT-530 partly because it had a clock. The Kenwood has lots of memories, but had some counterbalancing disadvantages. You just have to try them. By the way, you might also look at the Alinco DJ-580.

>4) Where can I get a cheap dual bander (144/440)? Is there a used ham
>market place?

Amateur Electronic Supply has a some used equipment, and I suspect that the other mail order houses also do. You can also try ham radio swap meets.

950. 220 Mhz handheld wanted

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 03:48:28 UTC
From: sehrlich@lynx.dac.northeastern.edu
Message-ID: <1993Aug20.034828.15051@lynx.dac.northeastern.edu>
Source record: 277578

I am looking into buying a 220 Mhz handheld sometime within probably
the next 6 months.

I was originally considering the Yaesu FT33R, but a friend of mine
quickly shot down that idea when he told me it runs through batteries
quickly and it gets hot quickly, too.

(I was considering the FT33R because I already own accessories for my
FT411E 2m and FT470 Dual-bander (2m/70cm).

The handheld on my list is the ICOM IC-3SAT. Nice and small, and I think
it has a built-in external DC power source connector.

What are comments on this handheld to other ones? I am mainly looking to
spend as little as possible (still in college), and I want PL encode for
those repeaters which utilize it. I also prefer compactness (which the
3SAT certainly qualifies for).

Comments please!

Thank you much.

Scott

Hello all,
I am looking for any Yaesu FT-5100 MODS for a new radio.

Thanks,
Mike

952. Re: FCC Collins 851S-1 and 851S-2 receivers

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 05:56:43 UTC
From: jherman@uhunix3.uhcc.Hawaii.Edu
Message-ID: <CC1n6J.KKJ@news.Hawaii.Edu>
Source record: 277581

David,
The Coast Guard used the 851 in all their shore radio stations. We had
16 of them at the Honolulu station set on various maritime frequencies. Four
of them were set up to scan the CW ship calling frequencies in the 6, 8, 12,
and 16 mHz bands. As I recall, an 851 cost the government many thousands
of dollars each (at least $10,000).
How much did you pay for them?

Jeff, NH6IL

953. Modifications - Data Base??

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 06:27:47 UTC
From: ak667@cleveland.Freenet.Edu
Message-ID: <251qt3$5ph@usenet.INS.CWRU.Edu>
Source record: 277583

I'm considering an idea of creating a database of modifications
for radios. I don't have many mods myself, but I do plan to
collect and save them. What i'd like to know is if anyone
knows of any that are on a FTP site, and if they are available
to thoughs of us who are only allowed email and usenet?

If not i'm asking the admin here, and at other places if i can
set up an account for sending out copies of modifications upon
request via email. And suggestions/etc would be apprecited.

>(Why do think it's called the 5th?)

That's O.K. if your tastes run more toward popular music. There's a song
by the scorpions (cant remember the title) that repeats _ ..._ ._ ._ ..._
in several spots. And one by ELO that also seems to send code in several
spots (again, cant remember the song, or pattern). In both songs the code
like patterns are sent with a guitar, or keyboard and seem to be coincidental
with the music (no message intended) Every time I hear them my brain goes
"Hey! where's the code coming from?

Hunter

>Without wanting to start RAWW3 (Radio Amateur World War 3!) between
>supporters of each of the major manufacturers, could some people offer
>their comments on thr myriad of 2m and 2m/70cm HT's that are on the
>market (both in the US and here in Australia).

The Icom IC2 and IC4 are wonderful radios. I owned both and they're virtually indestructable. The newer G line is good too. Sadly their micro-mini pocket scanners aren't so good. Nor have they made an adequate dual bander since the IC32.

The Yaesu FT470 remains one of the most ergonomic dual band radios available. The newer FT530 has some nice features, but I'm staying with the 470 until something *really* better comes along. Since it's my current carry radio, you can surmise I think it's the best value.

The Alinco HTs seem rugged, but not quite as polished. I've played with the 580, it's small and functional, but not as nice as the Yaesu.

Standard radios are gaining a good reputation, but they're a bit pricey. I haven't played much with them.

The stereo maker's VHF/UHF radios aren't worth using to chock a truck. They're fragile, run hot, and are prone to intermod. Their user interface is also bizzare. I guess if all you've ever had was K*nwood, you'd figure it out.

Then there are the real radios by Motorola, Ericsson, and Tait. Of course everything that needs to be said has been said about the HT220 and the GE Mastrs. They just work and work and work. Motorola's new HTX line seems really nice with almost as many bells and whistles as the Japanese radios. And in your part of the world, don't ignore Tait. They make fine rugged radios.

> offered any conclusive evidence of that).

FYI--The original posting said the woman went to a testing session and said she had *no* ham license. She then *failed* the Technician exams. (Not that this realy matters, since she still wouldn't be able to transmit the same day.) She was then seen talking into her HT latter the same day. Assuming of course that her HT was a ham radio (as opposed to a radio for some other band), then she clearly either lied to the VEs or was transmitting illegally. End of discussion.

However, the radio could have been for a different band (the original poster may have actually seen the radio's model number and recognized it as definitely being a ham radio, but I don't know for sure), and thus she was not necessarily transmitting illegal. (Of course, she could still have been, but we have no way to know.)

i am planning to take my general this sunday. right now, i am
waiting for my tech+ new call also. i took that test on july 10
(six weeks ago). after i pass my general, do i go back to waiting
for another 8 weeks or do i get my new ticket in 2 weeks (aprox.)?

i guess what i really want to know is, what happens to my 610 at
fcc, when another 610 arrives with new information.

No. Assuming you take tests through the ARRL VEC(*), what happens is that your general test and 610 get held up at the VEC until you receive your tech+ license. This avoids complicating the life of the FCC folks and slowing things down even more. When you get it, you send a copy of your license to the VEC and they will then forward your 610 for the general to the FCC and you wait another 10-12 weeks. However, you DO get to use your general privileges as soon as your first license arrives. On the 610 form you ALWAYS answer NO to the question of whether you have any other applications pending at the FCC. This will be correct because the VEC won't forward it while you do.

This is all explained in a letter you should be given before you leave the VE session.

| i guess what i really want to know is, what happens to my 610 at
| fcc, when another 610 arrives with new information.

See above. The VEC won't let that happen.

/JBL

(*) I'm not sure what other VECs do.

|> (Roman numeral)... so...he fiqured, why not ??? DiDiDiDaaah !!!!
|> (Why do think it's called the 5th?)
|>

I don't know why it's called the fifth other than the fact that it was the 5th one he wrote.
However the connection between the main beat of Beethoven's 5th and Samuel F. B. Morse's code is specious at best. Beethoven published his 5th in 1812. Morse first concieved the idea of the telegraph while travelling on the packet ship Sully in 1832. It was a number of years later before he published what was to become known ase Morse Code. Although it is possible that Morse based the letter V on Beethoven's rythmn, it is highly unlikely that there is any real connection between them at all.

Unless of course someone can provide reliable published data to the contrary.

bill KB3YV

PS. It should be obvious from the myriad postings under this thread that any association with CW at all does cause brain damage. ;-)

|> after all).

While it is tempting to contribute to the government-red-tape bashing, the
reality is that the funding for the FCC has been cut to the bone - and
amateur licensing is not a reimbursable income as commercial licensing is. I
think that one really good way to help them do a better job is to allow
them to charge a nominal fee for license handling. Otherwise, you can
expect low priority handling as they are not getting any funding for it. I
have seen other possible solutions, including offloading the data entry to
the VEC's and allow them to charge more for testing - this seems workable
to me. The FCC could process applications much faster if they didn't have
to do the human-resource intensive data entry. Some have criticized their
computer facilities, but I don't care if they're running a 4.77 Mhz 8088
based PC, you simply cannot blame their computers, it is a human
resource/funding/priority issue...

.>Can someone also briefly describe what a UHF, NMO, and N type connector look like?
.>
.>Thanks!
.>Dan N2PKE

If it looks like a PL-259 or SO-239 it is UHF

If it has a flat disk like contact it is NMO

If it looks similar to a PL-259 but with a thin pointed center conductor and fine threads on
the ring it is type N

8 watts xmit is nice, but not very important in a hand held. My big question is, "How did the receiver do at Dayton HF?"

Every ham handheld that I have used fails miserably at Dayton HF. They are plagued with all sorts of receiver products caused by the wide, overly sensitive, low dynamic range front ends they put in these beasts. (I have used ICOM 2AT's, 4AT's, 04AT's, and a couple of 2M and 440 Kenwoods belonging to friends.)

The only radio I have used that can handle the Dayton environment is my ICOM U16 commercial radio. It completely ignores all of the off channel signals. But then, it has a track tuned front end.

So, how does the IC-2GAT do at Dayton? Is it always breaking squelch with receiver generated products? Or is it quiet until something on channel appears?

I recently modified a radio to RX the public service bands, as well as 23 cm. What was done was to remove jumper 13, which in actuality did nothing. Then, by trial, jumper 1 was removed. This did enable the extended RX (and, in testin only into dummy loads, TX). Now for the problems. I have noticed that he ARS (Automatic Repeater Select) is non-operational. Similarly, wehen I do manually select an ofset, tone encode is turned on by default. SO, the questions:

-has anyone else experienced this.

-what are the other jumper pads, and what functions do they control?

-is there any way to force the unit to allow 30khz steps in the public service bands?

Thanks for any and all replies. I will summarize if significant replies are received.

|> access to the AP News wire, like somebody suggested, and it tends to puke on
|> Usenet messages 'cause people put the neato weird characters in them that it
|> doesn't like.

Even the AP newswire has characters in its text that aren't appropriate for code practice (or I'm not interested in learning them yet). I use the Unix "sed" utility to filter out those characters or change them into something else. You can easily write a "sed script" that will filter out anything you like. For instance, this removes the "Lines:" line from a news article header:

```
s/^Lines:.*$//
```

This substitutes the word "AND" for ampersand:

```
s/\&/ AND /g
```

This condenses multiple spaces into one space. Put it after the above command since that might generate extra spaces:

```
s/ / /g
```

I typed them from memory, don't flame me if they are wrong.
You can also filter out .signatures, change smileys into HI HI, etc.
If you get creative you can even make prosigns appear where appropriate.
So I have a file with about 25 commands like the above that filter the AP newswire to make it appropriate for code practice. You'd need more commands to do that for Usenet articles, but it's possible.
I'm running MKS SED on DOS, but I think there's a GNU SED that is free, or you could run it on Unix, where it is most likely pre-installed on your system.

By the way, AP news is one of the free services on Compuserve. I pay $7.95 and can download enough text for hours of code practice each day. The "latest headlines" file is good for more than a half hour at 20 WPM.
The "science and medicine news" file is probably good for an hour. I find these especially good for copying in my head, because I don't have to worry about copying 100% correctly, there is enough context to keep up if I miss a character or even a whole word. Thus, it's easier to drop the habit of stalling if you miss a letter.

I'm still practicing an hour a day. Should be ready for 20 WPM exams in two weeks or so.

Well, it's not the 'public service' bands you're interested in, since they
all use 12.5Kc spacing, and that's what the FT530 insists on while in the 800-
950 band. It's the Cellular band you're interested in, of course. Lemme know
if you find anything out. Go ahead and mess with all those other solder pads.
:)

Presently workers at the Kennedy Space Center are continuing to prepare Space Shuttle Endeavour for the STS-61 mission. They plan to install the 5th cryogenic tank set and perform main propulsion system leak and functional checks. Completed work on the orbiter includes ammonia boiler checks and orbital maneuvering system functional checks.

On Monday, August 30, 1993 and continuing through September 1, the Johnson Space Center will host a workshop for news media. The workshop will familiarize reporters with the training and operations leading up to the first servicing mission of the Hubble Space Telescope. The STS-61 mission is slated to launch in early December.

The 3 day workshop will include briefings on mission preparation and round-robin interviews with the 7-member crew. The mission preparation and overview briefings will be carried on NASA TV.

Hubble's servicing mission is scheduled to last 11 days and include several space walks. The mission will conclude with a landing at the Kennedy Space Center.

* POSAT-1 NEWS *
================
POSAT-1 -- POSSIBLE OPPORTUNITIES FOR AMATEUR EXPERIMENTATION

PoSAT-1 was built at the University of Surrey by SSTL staff and a team of 4 engineers seconded from Portugese industry. PoSAT-1 has been built as a technology-transfer project between SSTL and a consortium of Portugese aerospace companies. The satellite carries an Earth imaging camera, a CCD Star sensor, a Trimble GPS receiver and a digital signal processing experiment with TMS320C25 and TMS320C30 processors. Of course, the standard

on-board computer supporting standard PACSAT protocols is also provided.

Surrey is negotiating with the Portugese industrial consortium for PoSAT to operate in the amateur bands part time (its primary mission is outside the amateur bands). Part time amateur access would allow standard UoSAT-OSCAR-22 equipped stations to receive pictures from the camera and data from the GPS experiment. It is also possible to provide high speed modulation through the DSP system, which will allow radio amateurs to develop the necessary RF and digital techniques to go beyond 9600 bits/second.

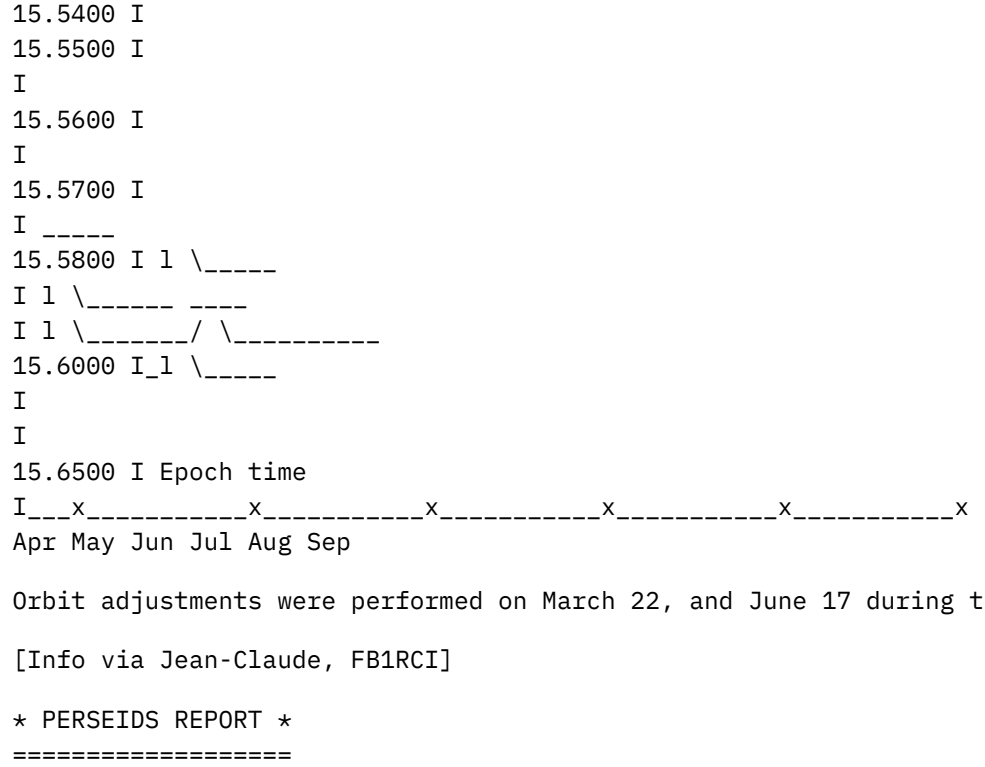
The PoSAT camera has the same optics as the KITSAT-A camera, but since PoSAT is twice as close to the Earth as KITSAT, resolution will be doubled. The narrow-angle camera should produce 200 meter resolution! Standard PACSAT Broadcast Protocol techniques will be used to download the images.

[Info via Jeff Ward, K8KA/G0SUL at the University of Surrey UoSAT Unit]

* MIR NEWS *
============
The following graph by Jean-Claude, FB1RCI depicts Mir's orbital mean motion (the number of perigee crossings per day) as a function of time. Keep in mind that mean motion is a function of altitude. The greater the satellite's altitude, the lower the mean motion.

Time revolution summary for the MIR Complex object 16609
(Period= day 79 to day 216 1993)

rev/day



Orbit adjustments were performed on March 22, and June 17 during this study.

[Info via Jean-Claude, FB1RCI]

* PERSEIDS REPORT *
====================
The following group of HAMS from Maryland travelled up to SKYLINE DRIVE to

observe the Perseids on Aug 11-12. They stopped at BIG MEADOWS (mile 51) on the drive and saw a great show! It was an average year as far as number of meteors, running about 40 or so an hour from 9 PM (11th) until 1:30 on the 12th. Skies were clear with excellent viewing conditions. There were a large number of very bright meteors this year, over 36 that went halfway across the sky and left very large smoke trails. The large number of "bright meteors" has led some to believe that we missed the core of the stream and went through the edge of the stream where we encountered a number of large fragments that had not been reduced to smaller dust type meteors, i.e. lack of collisions with their neighbors in the stream. The hams on hand were: WA3TAI, WA3ZII, N3OZM, KA3ZPA, KB3AGF and N3CAM, all members of the Southern Maryland Amateur Radio Club.

Besides, how does anyone know that she was transmitting with the thing, when she might just have been pretending to be? You can sit in a car and go "vroom vroom" and twiddle the steering wheel without needing a license. She could very well be a relative of Julian N6ARE, who put her up to this in order to provide us with entertainment for many weeks.

This has to be one of the most boring topics, and I apologize for prolonging its discussion...

USED HF & 6m RIG PRICE SURVEY
20 Aug 1993 Version

Here is a list of actual transactions involving buying
and selling of HF amateur radios.

I have absolutely no affiliation with any ham-radio-related
business. Rigs are sorted by maker, model, and price. All
transactions were made within the past three years. I welcome
any additional responses; please indicate maker and model of
your used rig, date bought/sold, how sold (Usenet, retailer,
on air, private, etc.), price, condition, and any accessories
or options.

981. Advice needed on rotor loop coax for QRO 432 MHz

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 20:58:56 UTC
From: dfeldman@teal.csn.org
Message-ID: <CC2syA.772@csn.org>
Source record: 277613

I am re-doing some antennas and want to be able to run QRO (>500W out, possibly more) to a single 432 yagi. The feedline is 7/8" heliax up the tower, and 1/2" heliax out the boom of the antenna, but the rotor loop is just RG213. Any suggestions on better (higher power handling and/or lower loss) coax for the rotor loop in this situation? It gets very cold out in the winter, so repeated flexing <0 deg. F is a likely condition.

73 Dave WB0GAZ

982. Simple Question...CW

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 21:36:39 UTC
From: depaul@spk.hp.com
Message-ID: <CC2up4.3rB@spk.hp.com>
Source record: 277614

Hello folks...

Well, I'm starting to get back on CW again after many years of non-use.
I want to get my code speed up to 35ish WPM, at present I can carry on a
QSO at about 17 WPM.

Do any of you have a CW technique that you use to kick it into high gear?

(Strange thing: I can copy 22ish WPM when I'm very tired.)

With Regards,

Marc DePaul

983. How does a Sweedish ham get a temporary US ham license?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-20 21:42:04 UTC
From: jennings@abb.COM
Message-ID: <9308202042.AA23686@nms1.abb.com>
Source record: 277611

Hello,

I have a question I hope someone can answer. An associate
of mine just arrived here in Rochester today from Sweden and
he will be staying here two months. Since he is a ham, he
was wondering what he needs to do in order to get a
temporary license to operate here. I know it is short notice
and there may not be enough time but at least he will know
what to do next time.

Thanks for your help and 73.

Tom Jennings kv2x

I saw this too, and have been meaning to ask about it on the net.

>I don't get any DX on this loop, so I think $250's going to be hard to
>justify.

I have yet to purchase the IsoLoop, but am SERIOUSLY considering getting it
due to antenna restrictions. Could you (or anyone on the net) elaborate as
to it's performance? I've heard good things and bad things. I guess I'll
have to get one and see for myself!

Contrary to the usual advice, I've found that sending faster helps me "copy"
faster. I put "copy" in quotes, because I quit trying to write down the
word-for-word copy years ago -- I'm no traffic-handler!

Cheers & 73,

Jim -- K5YUT

987. Bay Area 900MHz ATV???

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 03:11:18 UTC
From: efbasham@hp-ptp.ptp.hp.com
Message-ID: <19130029@hp-ptp.ptp.hp.com>
Source record: 277269

I'm currently viewing an NTSC signal on 921.5 - 927.5 MHz in Santa Clara, CA. It's about P2, with a colorbar background depicting 2 yagi antennas with an E-M wave propogating between them. There is a stylized logo in the lower right hand corner of the screen, looks like either a "B" or an "8" stretched out. This signal has been there for the past 2 nights (and probably longer!)

Does anyone know what this is? Is there an ATV repeater that has an output on 921-927 MHz? I doubt it's a video rabbit, since I'm receiving it with an R7000 and an omni antenna.

Also - I suspect there is a small banner moving across the center of the screen, but I'm unable to see that small detail with my reception. It may contain a callsign

Any help would be appreciated!

E. Fred Basham / KC6OSV

992. WAKE ISLAND DXPEDITION

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 09:07:49 UTC
From: chlee@farad.elee.calpoly.edu
Message-ID: <1993Aug21.090749.188964@zeus.calpoly.edu>
Source record: 277623

```
**************************************************************************
****** WAKE ISLAND DXPEDITION ******
AUGUST 20, 1993
FOR IMMEDIATE DISTRIBUTION

As of today, We are proud to announce the commencement of the Cal Poly
San Luis Obispo ARC DXpedition to Wake Island (KH9). All the necessary
arrangements have been finalized and all is go.

OPERATION:
Hawaii (KH6) Aug 30, Sept 10-12
Kwajalein (V73) Aug 31
Wake Island (KH9) Aug 31 --> Sept 10

BANDS:
Oscar 13
6 Meters (SCHED'S POSSIBLE)
10-160 meters (High Power)

MODES:
SSB, CW, RTTY

OPERATORS:
Craig Gullickson KC6CEX
Javier Campos AH6MM
Craig Boyer AH9B (CALLS SUBJECT TO CHANGE)
Chris Lee AB6EV
Kirk Fabrizio AH6ML
Pat Guerin NH6UY

There will be two fully operational stations complete with beams,
amps, computers, and loads of candy bars for the late hours.
We will make a special effort to listen for propagation to Europe and
the East Coast. Utilizing filters and proper antenna placement, we will
try transmitting two signals on the same band to maximize qso's in these
needed areas.

Thanks goes to all who have graciously opted to support us on this
great venture.

Good luck to all. We hope to work you on our propagation experiment
DXpedition to the Pacific.

73's de Craig KC6CEX (209) 227-2618
Chris AB6EV (805) 543-8467

993. 3 KW Generator for Sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 09:33:00 UTC
From: robert.garcia@sosinc.com
Message-ID: <2669.556.uupcb@sosinc.com>
Source record: 277532

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been refurbished and is offered for sale. The unit has a manually variable voltage output of about 16 to 36 volts at up to 105 Amps continuous operation. The generator will provide approximately 200 Amps intermediately if the circuit breaker is bypassed. These generators were originally designed to power military radio transmitters under extreme conditions or "jump start" large diesel engines in trucks and tanks.

IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5 to 30 volts at about 35 Amps per leg. The AC output is then brought through a bridge rectifier array to provide the DC power in the same manner as the alternator in your car. I have run regular 60 Hz items like a refrigerator, fan or coffee pot directly off a step up (28 v to 110v) transformer connected to one leg of the output of the generator. Higher 60 Hz voltages are available if the regulator is modified!

The generators are powered by a heavy duty four (4) cylinder air cooled industrial (Wisconsin) engine of 32 cubic inches and produce about 16 horsepower using ANY type of gasoline. The engines have a protected Fairbanks Morse ignition system designed to start and run under the worst weather conditions. This engine package is also used to power a military standard 5 KW or 10 KW 120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come equipped with a replaceable cartridge type oil filter and mechanical fuel pump allowing gasoline to be drawn from the integral 3.75 gallon tank or an auxiliary fuel tank. Repair parts are available at any auto supply outlet or outboard motor supply business. These generators were designed to be "GI proof" and have been maintained and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Providing "backup" power for solar systems.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
Conversion to 120/240 volt 60 Hz generators for emergency use.

Original cost to the US Government: $3467.00
Price: $600 each with Rope Starter FOB Baton Rouge, LA.
$675 each with Electric Starter FOB Baton Rouge, LA.

Weight: 275 pounds each
Dimensions: 35" Length, 24" Width, 25" Height
Fuel Consumption: Approximately 1 gallon per hour at full load

-> I also have a 1.5 KW gasoline powered 16 to 36 volt DC generator
for sale. This generator has been used to jump start 24 volt diesel
engine starters on both generators and trucks. The generator is
military surplus and is in excellent condition.

994. How to find the answers to frequently-asked questions about Ham Radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 09:44:04 UTC
From: ikluft@uts.amdahl.com
Message-ID: <ham-faq-ptr-1-745926243@uts.amdahl.com>
Source record: 277529
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

```
Posted-By: auto-faq 2.4
Archive-name: ham-faq-ptr

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
------------------------------------------------------------------------

This article will tell you how to find the answers to frequently-asked
Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on
the 7th of each month. This article is posted on the 14th, 21st, and 28th of
every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the
rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help
beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP
and from e-mail servers. This article contains instructions for obtaining a
copy of the FAQ. It also contains the table of contents from the FAQ so
that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ-----------------------------------

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews
------------------
If you are familiar enough with NetNews to look through previous articles on
your system, Option #1 above may be the easiest for you. The FAQ is posted
so that it should not expire from your site's news spool until the next one is
posted. Unfortunately, some news administrators do not honor the expiration
dates meant to preserve the FAQ.
```

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, FAQ updated daily
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, FAQ updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, FAQ updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, FAQ updated monthly
(Ham files mirrored from buffalo/funet/ucsd daily)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, FAQ updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

995. 3 KW Generator for Sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 10:51:00 UTC
From: robert.garcia@sosinc.com
Message-ID: <2670.556.uupcb@sosinc.com>
Source record: 277533

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been refurbished and is offered for sale. The unit has a manually variable voltage output of about 16 to 36 volts at up to 105 Amps continuous operation. The generator will provide approximately 200 Amps intermediately if the circuit breaker is bypassed. These generators were originally designed to power military radio transmitters under extreme conditions or "jump start" large diesel engines in trucks and tanks.

IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5 to 30 volts at about 35 Amps per leg. The AC output is then brought through a bridge rectifier array to provide the DC power in the same manner as the alternator in your car. I have run regular 60 Hz items like a refrigerator, fan or coffee pot directly off a step up (28 v to 110v) transformer connected to one leg of the output of the generator. Higher 60 Hz voltages are available if the regulator is modified!

The generators are powered by a heavy duty four (4) cylinder air cooled industrial (Wisconsin) engine of 32 cubic inches and produce about 16 horsepower using ANY type of gasoline. The engines have a protected Fairbanks Morse ignition system designed to start and run under the worst weather conditions. This engine package is also used to power a military standard 5 KW or 10 KW 120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come equipped with a replaceable cartridge type oil filter and mechanical fuel pump allowing gasoline to be drawn from the integral 3.75 gallon tank or an auxiliary fuel tank. Repair parts are available at any auto supply outlet or outboard motor supply business. These generators were designed to be "GI proof" and have been maintained and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Providing "backup" power for solar systems.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
Conversion to 120/240 volt 60 Hz generators for emergency use.

Original cost to the US Government: $3467.00
Price: $600 each with Rope Starter FOB Baton Rouge, LA.
$675 each with Electric Starter FOB Baton Rouge, LA.

Weight: 275 pounds each
Dimensions: 35" Length, 24" Width, 25" Height
Fuel Consumption: Approximately 1 gallon per hour at full load

-> I also have a 1.5 KW gasoline powered 16 to 36 volt DC generator
for sale. This generator has been used to jump start 24 volt diesel
engine starters on both generators and trucks. The generator is
military surplus and is in excellent condition.

>first concieved the idea of the telegraph while travelling on the packet ship
>Sully in 1832. It was a number of years later before he published what was to
>become known ase Morse Code. Although it is possible that Morse based the
>letter V on Beethoven's rythmn, it is highly unlikely that there is any real
>connection between them at all.

Since Morse's code was not designed to be sound based, the connection is even more strained. Morse intended the code to be decrypted by reading the marks made on a moving strip of paper by a pen attracted by an electro-magnet. It was only later that some operators noticed that they could often tell what was being received simply by listening to the pen clicking and clacking as it made the marks. Operators then invented the sounder to make the clicks and clacks louder and did away with the pen and paper strips.

Morse's code wasn't intended to be sent by hand either. It was sent by drawing a notched "port rule" across a set of contacts by means of a crank. The message was encoded by setting the proper notches on the rule. To save time, some operators began to manipulate the contacts directly, and discarded the "port rule".

So if you want to do Morse's code the way he did, you have to send and receive it by mechanical means, not with a key and ear. Morse would have been delighted by the ticker tape machines that came along later, or by the telex machine, since that's essentially what he was trying to invent.

>them to charge a nominal fee for license handling. Otherwise, you can
>expect low priority handling as they are not getting any funding for it.

This isn't really true. The FCC isn't allowed to keep the fees they collect, those go into the general fund and are really just a backdoor tax. Back when the FCC *was* charging amateurs a fee, their turnaround wasn't really any better. It still ran at least 6 weeks, and they were processing a lot fewer applications. Their appropriation today is $20 million *higher* than it was then, so you can't say they're starved for funds either. Their appropriation *is* small, but only in comparison to other government agencies which have received *huge* annual increases while the FCC budget has remained essentially constant for the last 20 years.

>I have seen other possible solutions, including offloading the data entry to
>the VEC's and allow them to charge more for testing - this seems workable

>to do the human-resource intensive data entry. Some have criticized their
>computer facilities, but I don't care if they're running a 4.77 Mhz 8088
>based PC, you simply cannot blame their computers, it is a human
>resource/funding/priority issue...

The FCC *says* it's their computer, more specifically their software. Apparently they are running a real antique machine that was coded in machine language many years ago by programmers long gone. There's little doubt that a moderm PC running a database language program could handle the whole process painlessly, but you've got to remember we're dealing with the government here. Nobody has any incentive to buck the system and fight for funding for a new PC and software, that's a capital expenditure and competes with scanners for the vans. By using the old system, they can justify 2 staff positions to feed it. The cardinal rule of bureaucracy is never do anything that reduces staffing.

a
One of the serious problems in FM reception is multipath and
this is helped through careful "adding" of the signals through
two antennas. One trick I found to see multipath is to take the
signal level output (S Meter) and DC couple this to the y axis of
a scope. The x axis on the scope goes to an AFC output. A nice
display of multipath (or lack theroff)...

I use a 3089/3189 FM receiver chip to do this. Maybe this would be
useful on HF for setting up diverse antennas??

RACESBUL.287 DATE: Aug. 16, 1993

SUBJECT: OPS: Official Relay Stations - Part 1/2

In emergency communications there are times when the only reliable communication path is via a relay station. Howard Shepherd, Manager, MacArthur Relay and frequent Alternate Net Control for the California Emergency Services Net, offers a perspective of how Official Relay stations serve a vital purpose. The Official Relay station provides an alternate means of communication between the NCS and responding stations on the net, regardless of the type of net. This function becomes critical in disruptions caused by interference, atmospheric conditions and other situations beyond the control of the NCS.
To best perform the Relay Station should be remotely located from the NCS station so as to minimize the disruption affecting the NCS.
To adequately serve, the Relay Station operator needs to be prepared to carry on a continuity in operations just as if nothing untold has occurred. In daily on-going net operations this means being prepared with the usual roster/rollcall, standard operating procedures and a familiarity with the typical NCS procedures. In order for the station to undertake a seamless operation in the unexpected moment, it needs up-to-date directories, maps, listings, SOP's and a full understanding of the Net's overall purpose.
Top performance comes from careful observation of the nuances of the net operations over time, as well as practice and continued self improvement. This requires careful monitoring and record keeping. Relief and standby operators may be called for in some extended operations and need to be considered as well as these other factors.
Operations alone is but part of the preparation. Equipment must be considered. An emergency power source is a vital requirement for lighting, radios and life support for the station personnel. An adequate emergency food and water supply is an

obvious requirement in an extended incident where commercial
power or facilities may be disrupted.
(To be continued in Part 2 of 2 parts)

RACESBUL.288 DATE: Aug. 23, 1993

SUBJECT: OPS: Official Relay Stations - Part 2/2

While not all relay stations may have multi-band,
multi-antenna, multi-operations facilities, such can come into
play in certain situations.The more versatile the station the
greater the likelihood the net will be well served. For example,
the California Emergency Services Net utilizes both SSB and Amtor
modes. In addition, the NCS can be involved in monitoring not
only the main frequency, but off-channel nets or sub-nets as
well. So, simultaneous multiple channel monitoring is an
important factor, as is the ability to operate on or monitor two
or more frequencies simultaneously.
The stations usefulness is enhanced with multi-line phones,
FAX and Packet for rapid transmission of data in a variety of
modes. While some of these may not be useful in certain
emergencies, one or more are frequently in operation.
A further usefulness of the Official Relay Station is the
addition of equipment, with appropriate licensing, to operate on
government frequencies. The State of Nevada, for instance,
assigned a portable on California Operation SECURE system.
This article is based on experiences as an Official Relay
Station with the California Emergency Services Net, as Deputy
Chief Radio Officer of L.A. County Disaster Communications
Service, as a Region Radio Officer and extended military
experience. It is intended to assist any Net Control Station in
obtaining reliable backup to essential communications in an
emergency.

1002. Address of J37AE

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-21 19:06:39 UTC
From: rc@cmr.ncsl.NIst.GOV
Message-ID: <9308211906.AA14780@cmr.ncsl.nist.gov>
Source record: 277530

Herb Sims asks for the address of J37AE. His 50 MHz card on my wall says
"D.C. 'Jim' Langdon
Sauteurs
Grenada
West Indies"
I've seen other addresses that include "Post Office" before "Sauteurs".
Sauteurs is a small town at the northern tip of Grenada.

I happened to meet Jim at Grenada's airport a couple of Januarys ago. I was on vacation, and noted that the fellow across the aisle on the plane took a transceiver out of the luggage rack when we got off at Saint George's. Turned out that he was an HF DXer going to J37AE's for a contest operation. I forget his call (sigh). J37AE was meeting him at the airport. Since the DXer was held up for a long time getting his rig into the country, I finally figured out who "MUST" be J37AE and introduced myself. Had a nice talk. He is long retired and only lives in Grenada during the winter.... thus you may have a wait for your QSL card.

Sauteurs is a LONG way over poor roads from the tourist area of Grenada, so I didn't press J37AE for a visit to his shack, which looks very nice on the card.

73, Bob W3OTC

1003. Re: 'Diversity Operation'?

Newsgroup: rec.radio.amateur.misc

You might be interested to know that the spread spectrum code division multiple access (CDMA) cellular system developed by Qualcomm includes five kinds of diversity.
1) Base station antenna diversity. Usually each base station has two receive antennas for each sector. Signals from two receivers are combined post detection.
2) Frequency diversity. The wideband (1.25 MHz) signal tolerates frequency selective fading as long as the whole 1.25 MHz bandwidth doesn't fade at once.
3) Time diversity. The system uses forward error correction coding with interleaving over a 20 msec time span so that short duration fades are taken care of.
4) Handoff path diversity. The system employs a "soft handoff" technique in which both of two nearby base stations transmit the same information to the mobile at the same time. The mobile has three independent correlation receivers which can receive from up to three base stations at the same time. Meanwhile, the two adjacent base stations both receive signals from the mobile which are then combined at the switching center.
5) Multipath diversity. This is the most interesting and unique diversity method because the system actually achieves a benefit from multipath instead of getting hit on the head. Typically, multipath in cellular communications will provide 2 to 4 paths with time spread of a few microseconds. The correlation receivers are able to independently receive these signals and then combine them constructively. The mobile has three independent correlators which can be used either to support multipath reception or handoff (or some of each.) The base station has a total of four correlators which can be used on the two receive antennas to support the antenna diversity or multipath diversity or both.

Naturally, keeping all this sorted out is interesting. ;-) Note that all three of the correlators fit in a single custom IC.

It has been proven to be very, very effective at providing reliable digital links in the cellular propagation environment.

One guy mentioned something that most of you failed to take into consideration.

The woman could have been in CAP. CAP rigs need not be commercial rigs, only
pass some very simple spectral purity checks, like most ham rigs do.

So, my guess is that 1, she in fact was bootlegging, or 2, she was a CAP op
that was waiting for thinking of getting her ticket.... too bad the guy did
not get a good look at her operating frequency...

(I think, for the most part, that she indeed was bootlegging)

Save your money and get a roll of magnet wire and a tuner.

I just acquired one of these this afternoon. It came from a friend
who was just sick and tired of it. He could have gotten us two, but
the other guy who pitched the one he had had too many morals to do
that to anyone he knew (unhappy was an understatement).

The fellow we got it from has had it in his apartment for less than an
year - never been outside of his covered balcony. The guy is a
retired engineer and the unit had not been abused.

His reasons for getting rid of it was that he made one contact with it
in the almost year that hes had it. He also mentioned that it was
almost impossible to tune - he would get it as close as he could
between fast and slow tuning and then use the antenna analyzer to find
out where it was actually at and then move the transmitter to that
frequency. He was having better luck with his home brew slinky
antenna.

I graciously accepted the present (a FREE $300 antenna - HOW VERY
NICE!), well that was about 6 hours ago. Now I am not so sure he *is*

my friend :-).

Since then three of us including our local antenna guru have been working with it. We discovered the MAIN reason that it was so hard to tune - massive backlash in the gears driving the tuning capacitor. We ended up disassembing the gear train and removing about 1/8" of the main gear hub so that it was reasonably centered over the worm gear. After that we raised the stepper motor in the antenna so the gears meshed properly and that took care of that problem. The pin that holds the gear to the capacitor shaft is a common nail, how very quaint.

After getting it all back together we tried to tune it up. No luck, it was still impossible to hit the brief (when I say sharp, I mean SHARP) peak in the noise. We hauled out the schematic and started looking for a way to slow down the tuning. We finally figured it out and got a reasonably slow speed, but still too fast. A bit more experimenting and we got it so we could single step the motor. This allowed us to be able to move thru the peak in maybe 10 steps. I suppose I should note that we tried several rigs and mostly 30 and 20 Meters (best we did here was 3:1 swr). The 747 wasn't real happy with that :-). I suppose that I should also note that the antenna was out on the balcony reasonably well in the clear, height about 25' AGL.

Paul is running through the bands again from 30 Meters thru 10 Meters while I wait. Commentary is that there is still noticible backlash in the geartrain which is especially noticible in the single step mode. Passing through the audio peak, depending on the band runs from 6 to 10 steps of the motor (backlash accounted for). How anyone could use this without the ability to move the stepper motor one step at a time is beyond me, the peak (dip to lowest swr) is VERY sharp.

Sat Aug 21 23:18:33 CDT 1993

We were not having any luck getting the swr down to something that wouldn't cook the 747, so we took a 3' 2x2 and bolted the isoloop to that with about an inch sticking out the top and 'C' clamped that to the mast that it was on. MUCH better results, as follows:

Band	SWR	Notes
30 Meters:	1.3:1	
20 Meters:	1:1	
17 Meters:	1.5:1	
15 Meters:	1.05:1	
12 Meters:	2.5:1	
10 Meters:	2.5:1	(28.395 Mhz)
10 Meters:	3:1	(28.06)
10 Meters:	4:1	(29.0) Looking for someplace usable...

Repeatability on these wasn't too tough once you get the hang of it. Still awfully time consuming.

Sun Aug 22 00:13:22 CDT 1993

Just for grins we tried 40 Meters - best we did there was infinity to one :-).

As a comparison we used a random length "dipole" strung around the apartment and using the mfj-949d tuner we were able to consistantly do 3db-10db better than the isoloop on receive and were able to tune it to 1:1 everywhere we tried (except 160 Meters) and it even tunes on 6 meters. Humm.

For $300 "worth" of antenna, I would personally be a bit more than disappointed. The control box is crude and with the lack of indicators to make repeatability a bit easier and the worst part is that tuning it without being able to single step the motor is a nightmare. I see why Bob and his buddy got rid of the things. The idea of spending another $259 for the "automatic antenna tuner for the isoloop" is folly, a *$600* antenna ? On the last item, the documentation for the isoloop declares a tuner to be unnecessary, did I miss something here ?

Our antenna guru's comments on the matter are: The enclosure for the antenna itself was appropiately shaped. Add two more fins on the back and pack it with explosives and you could have a real *useful* bomb :-). He suggests, rather than spending $600 for a lousy antenna, make an antenna and a matchbox and save the other $580 <grin>.

John has no comments - about 2100 local time he decided we were nuts to keep wasting our time and went and found something fun to do.

By me this is rated: not impressed. The thing that surprised me most when Bob brought it in was that it is HUGE. From the pictures I expected something much smaller. It ain't light to lug either.

When we took the control box apart, we found a small stepper motor in the box, but with the wires disconnected (it ended in a keyed connector, that is 4 wire that plugs into another connector on the circuit board that is 5 pins, but they are marked with ABCD). We hooked it up just to see what it did and it dragged the power supply (wallwart) down to unusability (it worked OK as long as you didn't plug the antennas cable in). Anyone else have one of these in the box ? What is the "stepper motor option" supposed to be? Nothing was connected to this, is it supposed to just make noise to make you feel better since there is no feedback from the antenna itself ? I would suppose that if you bought that option it would probably come with a bigger wallwart ? The schematic only shows it as a square with 4 wires coming out of it marked ABCD. No, Bob never took the cover off the box.

Thanks for sharing our evening of fun evaluating "the bomb". As I said when I started this, go get a roll of magnet wire and a tuner and find something useful to do with the other $200 (more or less :). I guess I am supposed to add here that your milage may vary :-)

Take care es 73, Vikki, Paul and John.

ZCZC AG29
QST de W1AW
ARRL Bulletin 87 ARLB087
>From ARRL Headquarters
Newington CT August 6, 1993
To all radio amateurs

The ARRL has asked the FCC to expand on a proposed rules change regarding DATA communications on the HF bands.

In comments to the FCC filed July 30 responding to a petition filed by the American Digital Radio Society (RM-8280), the ARRL asked that amateur stations under automatic control be allowed to operate outside the specific subbands proposed in an earlier ARRL proposal, RM-8218.

Under the new proposal, stations operating outside the subbands would be subject to three limitations: they must not be able to initiate transmissions, they must be able to respond only to interrogation by stations operated under local or remote control, and they must be limited to a bandwidth of 500 hz.

In RM-8218 the League had opposed automatic control on HF bands except in specific subbands until a plan could be developed to minimize interference to users of other modes.

But the ARRL Board of Directors, at its July, 1993 meeting, considered a report by its committee on amateur radio digital communications, which suggested a way that semi-automatically controlled data communications could be accommodated outside of the restricted subbands. The Board agreed with the committee's recommendation.

All interested parties will have an opportunity to comment if or when the FCC issues a Notice of Proposed Rule Making.

More information on RM-8218 is in August QST, page 73. More information on the Board's deliberations will appear in September QST.

1009. Which DSP Filter?

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-22 15:09:02 UTC
From: dbraun@ilx049.intel.com
Message-ID: <25826e$1e8k@ilx018.intel.com>
Source record: 277541

Looking through QST ads, I see these moderately-priced
DSP audio filters for sale:

Timewave Technology DSP-9 $149
JPS NRF-7 $250
j-com w9gr DSP 2 $299
W9GR Kit $125

Can anyone tell me the pros and cons of these units?
From the ads, they all seem similar. Obviously the
last two are virtually identical. I am most interested
in CW/RTTY filtering, with other features being
icing on the cake. Alas, I have no access to
back issues of QST, etc. to look up any reviews.

Thanks,

Doug Braun (N1OWU)

Hello, I am trying to gain access to the ARRl library of information. I am
the current newsletter editor of our local Ham clubs (the Winnipeg Amateur
Radio Club, and the Manitoba Repeater Society) in VE4 land. I would like to
have access to ARRL so that I can view and reprint articles (with permission of course) in
our newsletter.

Our club is a member of RAC (formally CRRL, and CARF) and a lot of our
members are also members of ARRL.

If anyone know how I can access the ARRL library of info please send me a e-mai
on this subject. Also if anyone wants to exchange newsletters please
let me know that as well.

KITSAT-B: First Independently Built Korean Satellite

AMSAT-NA would like to correct a bulletin a few weeks ago with respect to KITSAT-B. The KITSAT-B satellite was NOT built at the Univeristy of Surrey but at the Korean Advanced Institute of Science and Technology (KAIST). The satellite was built entirely in Korea using an all-Korean team. Members of this team were trained at Surrey and built KITSAT-A (now known as UO-22) at Surrey; however KITSAT-B is a completely Korean effort. This independent effort is considered to be an important phase in the educational "technology transfer" between Surrey and KAIST.

POSAT-1: Possible Opportunities For Amaetur Experimentation

PoSAT-1 was built at Surrey by SSTL staff and a team of 4 engineers seconded from Portugese industry. PoSAT-1 has been built as a technology-transfer project between SSTL and a consortium of Portugese aerospace companies. The satellite carries an Earth imaging camera, a CCD Star sensor, a Trimble GPS receiver and a digital signal processing experiment with TMS320C25 and TMS320C30 processors. The standard on-board computer supporting standard PACSAT protocols will also be provided.

Although its primary mission is outside the amateur bands, Surrey is negotiating with the Portugese industrial consortium for PoSAT to operate in the amateur bands part ot the time. Such part time amateur access would allow standard UoSAT-OSCAR-22 equipped stations to receive pictures from the camera and data from the GPS experiment. It is also possible to provide high speed modulation through the DSP system, which will allow radio amateurs to develop the necessary RF and digital techniques to go beyond 9600 baud.

The PoSAT camera has the same optics as the KITSAT-A camera, but since PoSAT is to be at half of the altitude of KITSAT, resolution should be doubled. The narrow-angle camera should produce 200 meter resolution. Standard PACSAT Broadcast Protocol techniques will be used to download the images. The amateur community will be kept informed as negotiations with the Portugese Consortium continue. Mail from radio amateurs who think they might be interested in receiving PoSAT-1 in the amateur bands would be appreciated and might help in conducting these discussions. Please send

your comments and suggestions to the following address:

PHASE-3D STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 233.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-233.02

WD4FAB Provides Latest Phase-3D Status Report & Request For Assistance

Dick Jansson (WD4FAB) AMSAT-NA VP for Engineering, reports that the assembly of the Engineering Structural Model for Phase 3-D is now nearing completion in Germany. As many of you know, Dick, along with a team from Weber State University, has been working on this critical task for the past month with Dr. Karl Meinzer (DJ4ZC) and Werner Haas (DJ5KQ) of AMSAT-DL. Their goal has been to confirm the form, fit and function of structural designs for the new satellite. Dick says that the effort has been a tremendous learning experience for all. It has also given everyone involved a much clearer vision of where and how we must proceed in the months to come in order to be ready for launch in 1996.

As this stage of the development draws to a successful close, and as a direct result of the process, Dick now foresees that some additional, and immediate, machining expertise for the spacecraft thermal structure will be required beyond that already being expertly provided by our Weber State University people. He's asked that an urgent request be made for some additional help with machining some of the structural parts for the spacecraft.

Anyone with "hands on" machining experience, particularly in the milling and fine finishing of metal parts, and who also has both the spare time and use of facilities to donate to the Phase-3D cause are welcome to volunteer. Anyone who would like to help, or knows of someone who can, please contact Dick Jansson (beginning August 24th) at (407) 644-9008, or fax him at (407) 644-9782.

[The AMSAT News Service (ANS) would like to thank Dick Daniels (W4PUJ) for the information used in this bulletin.]

AMSAT OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 233.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-233.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz

Date UTC Mode Phs NCS Alt NCS

28-Aug-93 1830 B 157 WJ9F VE2LVC
11-Sep-93 0730 B 159 VE2LVC W9ODI
18-Sep-93 1515 B 96 N7NQM W5IU

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on immediately after the OPS Nets a downlink on a Mode-B downlink frequency 145.960 MHz.

HR AMSAT NEWS SERVICE BULLETIN 233.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-233.04

Weekly OSCAR Status Reports: 21-AUG-93

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Aug 14-Oct 25
Mode-B : MA 0 to MA 60 !
Mode-BS : MA 60 to MA 120 !
Mode-S : MA 120 to MA 145 !<- Mode-S transponder; B transponder is OFF
Mode-S : MA 145 to MA 150 !<- Mode-S beacon only
Mode-BS : MA 150 to MA 210 ! Blon/Blat 180/0

Mode-B : MA 210 to MA 256 !
Omnis : MA 170 to MA 15 ! Move to attitude 210/0 25-Oct-1993
Continuous up-to-date information about AO-13 operations is always available on the beacons at 145.812 MHz and 2400.646 MHz in CW, RTTY and 400 bps PSK. Also, these bulletins are also posted to INTERNET, ANS bulletins, Packet, PACSATs, etc., and can also be found in many international newsletters. [G3RUH/DB2OS/VK5AGR]

RS-10: WB2WPA reports excellent results at his QTH with RS-10. He notes that he has worked 12 states and a number of VE provinces in casual operating over the past few weeks. He installed an Advanced Receiver Research (ARR) 10M preamp, and he saw his signals rise to S-9+. Also, WB2WPA has seen good "over-the-horizon" results for about 1 minute before AOS and after LOS recently running 80 watts to a 15 element beam with horizontal polarization. Also, WC9C reports that the RS-10 transponder is working just fine. With the Solar Flux dropping below 100, Mode-A signals even during the day light hours are fairly strong. The transponder activity was very high last week with at least 3 DX stations heard. There was no message on the telemetry beacon this week, and the CW Robot was also working just fine. [WB2WPA & WC9C]

RS-12: GM4IHJ has been copying RS-12 well into the evenings in the UK while it is "sub-horizon" at the terminator over UA0. He notes that it is well worth the time for RS-12 operators to be looking for the satellite long before AOS and long after LOS and even on "out of range" passes to the north. If you can hear the 29.407 MHz beacon the chances are that the satellite transponder will hear your 21.210 - 21.250 MHz uplink. WC9C reports that RS-12 Mode-K transponder is working fine with lots of activity. With 15M dropping off as the solar flux falls, he says that there is alot less interference to the Mode-K uplink passband. At the end of the telemtry frame there was this test message which said: "Test test test RS3X QTH Kaluga" [GM4IHJ/G3IOR & WC9C]

AO-16: Operating normally. [WH6I]

UO-22: Operating normally. [WH6I]

KO-23: Operating normally. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

1013. Want Ten Tec OMNI elmer / help!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-22 20:39:44 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9308221339.aa19492@Paris.ics.uci.edu>
Source record: 277544
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Anyone out there familiar (or want to become familiar) with the older OMNI ? I have an OMNI-D series C, the precursor to the Corsair. I am having some funny (read: hard to diagnose) problem that is driving me completely nuts.

Briefly, I have 50 db less receive on ONE band only. 160 meters is way down, all the other bands seem OK, they may be down a little, but not much. The "resonate" control (preselector) will peak in the 160 meter band, but it peaks much higher towards the bottom of the 160 range, and loses sensitivity rapidly above 1.8. The receive antenna seems to come through the pin diode attenuator (which seems to work normally....) and then to the RX trimmer board with some fixed caps and a trimmer cap. I have replaced the 160 meter caps. It is not them. Then the signal goes to the RF amp which seems to be a parallel tuned inductance for adjustment

I know the problem has to be in there, for when I connect the antenna to the mixer directly, I have plenty of signal on 160 (perhaps the solution is to wire the antenna directly there for 160, hi hi).

So, how does a pin diode work for an attenuator? Is leakage on one frequency possible? AND, could the parallel tuned inductors have come out of sync in such a way as to affect only 160 at one end of the band?

.........help!!!! I really like the radio a lot, and I want to use it on 160 as well as all the other bands.

In <1993Aug20.124345.28826@ke4zv.uucp> gary@ke4zv.uucp (Gary Coffman) writes:

>The Icom IC2 and IC4 are wonderful radios. I owned both and they're
>virtually indestructable. The newer G line is good too. Sadly their
>micro-mini pocket scanners aren't so good. Nor have they made an
>adequate dual bander since the IC32.

I know someone who has an IC-R1. I prefer my Alinco DJ-X1 over it,
mainly due to the packaging differences and durability. Performance-wise
they seem roughly the same.

>The Yaesu FT470 remains one of the most ergonomic dual band radios
>available. The newer FT530 has some nice features, but I'm staying
>with the 470 until something *really* better comes along. Since it's
>my current carry radio, you can surmise I think it's the best value.

The FT-26 is getting much publicity here. I know people who swear by
Yaesu gear, and others who despise it! There is a large retail consumer
electronics chain (Dick Smith Electronics, who were an electronics
enthusiats store until a supermarket chain bought them!) that is the
local dealer for Yaesu stuff, so it's available everyhere (in Oz), which
I guess is one advantage.

>The Alinco HTs seem rugged, but not quite as polished. I've played
>with the 580, it's small and functional, but not as nice as the
>Yaesu.

I received an email reply about the 580, and the impression gained from
that message is of the 580 being quite good. I think Alinco have only
to rework some of the methods of operation of their radios and they will
be a serious competitor to the 'big three'.

>Standard radios are gaining a good reputation, but they're a bit
>pricey. I haven't played much with them.

We don't hear much about these here. I think there have been a few reviews
over the years that I have been spotting radio mags, but that's all. I
have no idea what their model range is like, or how the features and
pricing compare to other manufacturers.

>The stereo maker's VHF/UHF radios aren't worth using to chock a truck.
>They're fragile, run hot, and are prone to intermod. Their user interface
>is also bizzare. I guess if all you've ever had was K*nwood, you'd figure
>it out.

We have Kenwood UHF radios at work (freight train depot), and they are
absolutely cr$%py, useless pieces of, dare I say it, junk. I wonder when
Sony, Pioneer, etc. will start making radios for the amateur market!?!

>And in your part of the world, don't ignore
>Tait. They make fine rugged radios.

Tait? This is one I haven't heard of.

In article <252l2c$j4r@charm.magnus.acs.ohio-state.edu> I had written:
>
> i am planning to take my general this sunday. right now, i am
> waiting for my tech+ new call also. i took that test on july 10
> (six weeks ago). after i pass my general, do i go back to waiting
> for another 8 weeks or do i get my new ticket in 2 weeks (aprox.)?
>
> i guess what i really want to know is, what happens to my 610 at
> fcc, when another 610 arrives with new information.
>

well, i passed my 3b, 4a, and 4b elements in a *arrl* test session.
1c, the 20 wpm test was a different story. halfway into the test,
the ve's stoppped it, told me that it was the wrong tape, and
restarted the test. i simply could not copy any more, and failed 1c.

right now, i have my novice call, and csce's upto advanced. my new
tech+ callsign should be here in about three weeks. these ve's did
not want to hear about the tech+. i was told firmly that, they would
not hold my application till i got my new callsign (n8???), and
that in about 8 weeks time from today, when this new 610 with all
credits upto advanced ticket gets processed, i get *another*
callsign. this was even after my trying to convince them to hold my
papers for three weeks until i get my new ticket and my 1c credit!

so, now, thanks to the delay in processing by the fcc, everything is
going to work ok.....but, needless to say, i am a bit disappointed
at all this confusion, and one tech/general callsign going waste
after about 5 weeks of use..... not to mention another $5.60....

73 es cul,
krishna
kb8fav/aa

ps: i guess i will just have to become a ve myself :-)

pps: i can't wait to get on the air with all the tremendous hf band
width available now.... well, actually i want that bottom 25 kHz too!
:-)

SB DX @ ALLBBS $OPDX.124
Ohio/Penn DX Bulletin No. 124

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 124
BID: $OPDX.124
August 23, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, PS7KM, SV2WT, AD1C, NT2X, WB3LHD, AC4NJ, K4CEF & Southeastern Cluster Group, N4VZ, KC6CEX and WG9B for the following DX information.

3V, TUNISIA. According to LX2KQ, German amateurs are saying that 3V8W is definitely a slim. They have contacted DK2WV, the individual who 3V8W says is his QSL manager, and he states he has absolutely no knowledge of this operation.

5A0RR AND ROMEO (Excerpts from Romeo New Release, received by ed, NT2X). Romeo states, "Originally, plans called for the use of six amateur radio operators for 5A, but due to the lack of funding we had to limit ourselves to three operators: Said (Libyan), who currently holds the call sign 5A0RR, Danny, LZ2UU and myself. During the operation, which lasted five days, we worked over 11,000 stations.
This DXpedition coincided with the International Arab Summit being held in Cairo, so National security throughout the region was at a fever pitch. The Dxpedition was terminated when Danny and I were accused by Libyan counter-intelligence and Egyptian police of planning to assassinate both President Mubarek and Libyan Leader Quaddafy. To make matters worse and even more bizarre, they said we were using ham radio as a cover for illegal drug trafficking by communicating with Turkish ships in the ports of Benghazi and Alexendria. We were both arrested and placed in the Libyan prison and held incommunicado. This unpleasant experience, the details of which I will not go into at this time, has caused my health to deteriorate greatly and I am currently under doctor's care and receiving medical treatment.
Said, 5A0RR, will continue to operate from Libya under this call sign which is in effect for two years. We left him an FT-990, a FL-7000 amp and a Mosley antenna. He is an outstanding CW operator but might be limited in his SSB operating since we didn't have the opportunity to train him in this mode.

Copies of the 5A0RR logs are in Bulgaria. QSL's are being sent. If my medical condition permits, I hope to travel to the United States soon. At that time I will present the documentation for the 5A-Libyan operation to the ARRL. I also have in my possession the additional documentation requested by the ARRL for the P5-North Korean DXpedition." - Warmest regards. 73, Romeo, 3W3RR/AH0M/RV7RR/EK0RR/XY0RR/IS0RR/9D0RR/YA0RR/5A0RR and forty-five other call signs.
In Romeo's release he also expressed his disappointment in the support he received from the ham community during his ordeal. The unwarranted and undeserved criticisms, along with false charges disturbed him a great deal. Romeo's whole news release can be downloaded from the BARF-80 BBS (under DX News and Rumors, bulletin 20) at 216-237-8208.

9G1AA, CARDS (UPDATE). Cliff, AC4NJ, has informed OPDX that about 1000 cards would be sent out on August 20th. But as of Sunday morning there were reports stating 1200 cards were mailed with the possibility of 4000 more to arrive soon from the Netherlands in bulk via air. The majority of the cards will arrive within the next ten days or so. All cards should be out by the middle to the end of September. Because of several pirates operating during the 9G1AA operations, "ONLY" those individuals that receive their cards back with "NOT IN LOG" can call Cliff at 904-799-0708 to re-check the logs or mail their returned card (with the "NOT IN LOG" on it) with a SASE to AC4NJ. Cliff is not (REPEAT is not) the QSL Manager for 9G1AA, but is just helping because of the many "NOT IN LOG" contacts.

A5, BHUTAN. This is one of this week's interesting reports. There is a report of an Orthopedic Surgeon comtemplating about getting a ham ticket, because he has been invited by the Bhutan government to teach surgery. They have also given him permission to operate on the ham bands. His trip to A5 is scheduled to take place January 1994. Stay tuned and KYFC!

KH9, WAKE ISLAND. Just a reminder of the Cal Poly San Luis Obispo ARC DXpedition to Wake Island (KH9) will take place next week. Their operating schedule is as follows: Hawaii (KH6) Aug 30 & Sept 10-12, Kwajalein (V73) Aug 31 and Wake Island (KH9) Aug 31-Sept 10. Their activities will include: Oscar 13, 6 Meters, 10-160 meters (High Power), SSB, CW and RTTY. The operators are (CALLS SUBJECT TO CHANGE): Craig/KC6CEX, Javier/AH6MM, Craig/AH9B, Chris/AB6EV, Kirk/AH6ML and Pat/NH6UY. There will be two fully operational stations complete with beams, amps, computers, and "loads of candy bars for the late hours". They will make a special effort to listen for propagation to Europe and the East Coast. Utilizing filters and proper antenna placement, they will try transmitting two signals on the same band to maximize QSOs in these needed areas. They hope to work all on their propagation experiment DXpedition to the Pacific.

PY0S, ST. PETER & ST. PAUL ROCKS. The NATAL DX Group is planning a new DXpedition to here in January/February of 1994. Their plans are to activate PY0S with four operators, running two stations full time on CW/SSB, all bands including the WARC bands, RTTY, 6 meters (CW/SSB), packet and satellite operations. This will be the first time that packet

and satellite operation will be used here. PT7WA will be the QSL Manager for CW/HF. QSL info for SSB/PACKET/RTTY/6M was not mentioned, but we are sure it will be forthcoming.

SV/A, MOUNT ATHOS. Nikos, SV2WT, has informed OPDX that Minoru, JA3MNP, and himself do not have a license to operate from SV/A-land and Monk Apollo, SV2ASP/A, is the only amateur licenced to operate from Mount Athos. Both Nikos and Minoru will be going to SV/A-land to donate equipment to Apollo for RTTY operations. They may make 2 or 3 QSO's under the callsign of SV2ASP/A for testing the equipment only. Nikos states that Apollo continues to be inactive, but hopes this will end by the end of September. In the information sent to OPDX, Nikos states, "Please I ask also to amateurs around the world to send letters to Apollo and tell him to come back on the air".

TY, BENIN. Ken, WA4OBO (the earlier op at TT8OBO), will be returing to the states on August 26th, but he will travel to Benin and be active Septmeber 12-21. His call sign will be TY8OBO.

V2, ANTIGUA. Ron, G4DIY, will be active as V2/G4DIY until September 1st. He will be active mainly on 14288 or 14260 kHz, or on 15 meters if the band is open (check 21288 kHz).

ZK1, NORTH COOK ISLANDS. Dick, N7NKG, continues to be active until September 4th. He is using the call sign of ZK1XR from Manihiki Atol (IOTA-014). He is to be active on both CW/SBB, but has only been heard around 7007 kHz between 0815 and 0915z on the Ohio/Penn Network. QSL via his CBA.

ZS9, WALVIS BAY (Maybe headed for DELETION?). From The New York Times (Aug. 17) - "In the first decision by the multiparty forum that will substantially alter the shape of South Africa, negotiators agreed today to hand over its enclave at Walvis Bay to neighboring Namibia as soon as possible.
A South African Government delegation, led by Foreign Minister Roelof F. Botha, agreed under pressure from the African National Congress and other opposition groups to transfer the enclave, 800 miles north of Cape Town on the Atlantic Ocean, and several islands to Namibia." (ed. Does this mean maybe the Penguin Islands too?)

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

1017. Re: Help!...RF Everywhere!

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-23 01:12:05 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9308221811.aa21069@Paris.ics.uci.edu>
Source record: 277546

Hi Marc:

I sent this to your personal address 5 days ago, it never made it.
Here goes to the board. Some of it has been said, maybe some of it
will help.

First, I would try to take out the air balun you have between the rig
and the tuner. This is not needed, and just may create some extra RF
paths. Make yourself a SHORT jumper of RG-8 for the rig into the tuner.
This is how the system is designed to work.

Second, try to improve the ground in one of several ways:

- run an extra ground rod or two into the ground.
- shorten all ground leads and eliminate extension cords where possible.
- create RF counterpoise, use quarterwavelengths of wire attached to the
ground terminal of the tuner on each band you will use and run them out
under the carpet or into the yard or something.
- shield the heck out of the outboard processor (why don't you use the internal
one, BTW? Its not real great, but not bad at all!)
- shield keyer leads and power supply leads (and shorten) the best you can
- pray at the right church (I am not sure about this method, but it seems to
work for many people :-)

73, and I have cured problems just like this...take heart, it can be done.

Clark

Has it really been 25 years since incentive licensing kicked in? My mags only go back about 22 years....and i've seen the year 1968 used...

i plan to drop by the local college library when school starts, but if there's someone that can point me to the "definitive issue" of QST that it was all spelled out, i'd appreciate it.

If this IS the case, man, have I got a practical joke to pull.....the silver anniversary of I. L......

replies either in the group or to:

I see the Roanoke Doppler DF kit being advertised in WorldRadio. Seems like a very reasonable price for this type of capability. Has anyone on the net had experience with this unit? Comparisons, advice?
-Jack- n7oo@huachuca-emh8.army.mil

those of the Broadcast Officer, the Relay Officers, or of the
Society.

ANARTS Contest entries

Please note: If you wish to enter the ANARTS Worldwide RTTY
Contest, remember the closing date for logs is 1st September -
thats only 9 days away. Some stations that were observed work-
ing during the contest have not yet sent logs, although some
few were very active. Worth a check?

Be in it, you might win your area, or better still, your
class, but dont be late or it will all go to naught.

Address logs to: Contest Manager
Jim Swan VK2BQS
P.O. Box 93
Toongabbie NSW 2146
Australia

The following was sent (by packet) to our President earlier
this week. Good to see the interest shown by another club.

Hi Col,
just a note to let you know that the TTY files are
displayed at VK2CZR, (Chifley ARC Inc.) BBS and read by many.
Thanks to all the team for your efforts! (VK2CZR - QF56JH - St
Clair)

Thanks to the committee at Chifley for taking the time to
interest their members in RTTY by way of the broadcast, and

for taking the trouble to let us know about it.

JOTA JOTA JOTA

Pull out that old RTTY gear you may not have used for a while, check all the dry joints, lubricate the mechanicals, and get it up and running. JOTA is coming closer, and here is a warm-up for the event.

We will repeat this information closer to the event.

PRE-JOTA RADIO ACTIVITY!

ON THE LONG WEEKEND, 2/3/4TH OCTOBER, 1100 PLUS SCOUTS AND LEADERS FROM CUMBERLAND AREA WILL HOLD THEIR 1993 JAMBORETTE AT SILVERDALE, NSW.

A MULTIMODE AMATEUR RADIO STATION WILL OPERATE OVER THE WEEKEND USING THE NORMAL SCOUT FREQUENCIES (AS WELL AS OTHERS). THIS IS AN IDEAL OPPORTUNITY FOR EVERYONE TAKING PART IN JOTA 93 TO FIRE UP THEIR SYSTEMS AND MAKE A COUPLE OF -TEST- CONTACTS WITH THE BASE IN PREPARATION FOR THE BIG WEEKEND A FEW WEEKS LATER.

DIGITAL MODES WILL BE A FEATURE OF THIS YEARS ACTIVITIES SO DROP US A LINE AND SAY HI! AND DONT FORGET THE PHONE MODES ON THE SAME WEEKEND AS WELL - WE WILL BE LOOKING FOR YOU ALL.

WE ARE SEEKING PACKET MESSAGES THAT YOUNGSTERS AND ADULTS CAN REPLY TO, AND THE REPLIES SHOULD BE BACK TO YOU IN TIME FOR JOTA! OUR ADDRESSESS WILL BE :

SCOUTS @ VK2CZR.NSW.AUS.OC, OR
VK2CS @ VK2CZR.NSW.AUS.OC,

AND OF COURSE SIMPLEX OPS WILL BE ARRANGED ON 145.825 FOR A QSY FREQUENCY. PLEASE UPLOAD MESSAGES TO THE JAMBORETTE FOR EARLY RECEPTION AT VK2CZR. 73 ES GL

FROM COL VK2CS

ANARTS welcomes JOTA information -- remember we cover Australia, make use of the broadcast to let people know where your stations will be operating and with what modes. We are pleased to help in any way we can.

Dont forget the SARTG WW RTTY Contest is on this weekend. Have a listen or take part for a while. Remind the other side of the world that we are here.

IPS weekly report
---
13 August - 19 August 1993

Issue no.: 34
Date of issue: 20 August 1993

Date 13 14 15 16 17 18 19
10cm 97 92 91 90 93 92 921
A 07 02 17 44 24 19 (12 estimated)
T 51 51 49 68 38 55 54

Summary of activity

Solar activity was low 13th-17th August, and low on 19th-19th.

The geomagnetic field at Learmonth (WA) was quiet 13th-14th, quiet to unsettled on 15th, and 17th-19th, and active to minor storm levels on 16th.

Ionospheric F2 critical frequencies at Sydney were near predicted monthly values on 13th-15th, followed an enhanced period of up to 30 per cent 0200-0400 UT on 16th, then returning to near normal. Depressions of up to 15 per cent were observed from 2100 UT on 16th through 17th. F2 frequencies returned to near predicted values thereafter, with spread F conditions 1800-2000 UT on 19th.

Forecast for the next week (20 - 26 August)

Solar : Low.

Geomagnetic: Quiet to unsettled until 24-26th, when unsettled to active levels are expected due to a coronal hole.

Ionospheric: Near normal.

Courtesy of IPS Radio and Space Services

VK2SG RTTY DX Notes, 13 August

VK2SG RTTY DXNotes for weekending 13 August 1993(BID RTDX0813)

If the DX notes appear short this week, I must apologize, but the conditions as they have been for the past week, reports have been few, and information has been scarce. Maybe everyone was chasing the E31A. So all that I can say is that we are not up to our usual standard this week, but we have done our best.

Our information this week came from CE3GDN, ZS5S, 9X5LJ, W2JGR, WB2CJL, G3FZW, I5ICY, DJ3IW and the Central Europe DX-Cluster node DB0SPC, and NJ0M node of the Twin Cities DX

Packet Cluster.

November 13th-14th WAE RTTY Contest

For your information

As there is often QRM on the 40 metre retransmission of the cast, please note that the transmission will be 3 down from the advertised frequency.

There is also a possibility of the evening 80 retransmission moving to a different frequency. We will keep you informed.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065 Australia, for such matters as membership and general enquiries. Enquiries can also be made by packet to the President (Col) VK2CTD, or the Secretary (Pat) VK2JPA @ VK2RWI.

News items may be sent to Broadcast Officer PO Box 60 Blacktown 2148 Australia, or by packet to VK2JPA @ VK2RWI. The Internet address for the Broadcast Officer is : patl@extro.ucc.su.OZ.AU

We are looking forward to news from your areas to let others know what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer

That concludes ANARTS BULLETIN 773 22/8/93.
Inserted by VK2BQS (Jim) Vice President ANARTS.

Hello eric, just curious, you said you removed Jumper 11 and it gave you 23cm (1200MHz) receive?? that's strange... if the pll would lock up in that band, it'd be worth it, there's a few 1.2 gig repeaters in the area. Thanks, 73's.

Klein:

Don't forget that the capacity is maintained by power agility and we would need Qualcomm technology put into an affordable form for us to be able to successfully utilize it. (Hint ;-).

Bob

> tech+ callsign should be here in about three weeks. these ve's did
> *not* want to hear about the tech+. i was told firmly that, they would
> *not* hold my application till i got my new callsign (n8???), and
> that in about 8 weeks time from today, when this new 610 with all

don't confuse the VEs with the VECs....the VEs have to get their stuff into the VEC in 10 days. I can usually have my stuff packed and into Airborne the same day (it only takes as long as it does because i put together a log of what examiners were there, who passed what and make up the PSA for the next month's exams...so when i'm finished, i have the airborne package, the PSAs for the local news sources (24 at last count), my file copies of the CSCEs and candidate roster in the filing cabinet and my computer files updated.)

the VEC holds everything until a package is complete so the FCC sees only completed paperwork that results in a new license issued. I'm certain the VECs would not mind dumping it all on the FCC except that it would gum up the works even more.

and by all means get your VE accreditation...we can always use the help. (good help can be _so_ hard to find...8))

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: Amateur Radio licenses usually arrive between 8 and 10 weeks after the test session. The FCC considers their processing time to be 90 days--from the date they receive the application. The FCC usually receives the application one to two weeks after the test session (once the VE Team and the coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a Morse code test) will not receive a new license from the FCC. The existing Technician license plus the CSCE conveying the Morse code test credit is the only documentation issued for use of the additional HF privileges.

****

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Electronic mail may be forwarded to the ARRL/VEC via USENET at "bjahnke@arrl.org" or via MCI Mail to MCI ID: 215-5052.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials. Electronic mail may be forwarded to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
find any examinations listed for your area, you may contact
any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
The 1993 Test Fee is $5.60.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;
(d) 907-786-8121, (n) 907-243-2221 (or) 907-276-5121
(or) 907-274-5546

C = Central Alabama VEC, 1215 Dale Dr SE, Huntsville, AL 35801;
205-536-3904

N = Charlotte VEC, 227 Bennett Ln, Charlotte, NC 28213;
704-596-2168

D = Great Lakes ARC VEC Inc., PO Box 273, Glenview, IL 60025;
708-486-8019

E = Golden Empire ARS, PO Box 508, Chico, CA 95927; No phone.

G = Greater Los Angeles ARG, 9737 Noble Ave, Sepulveda, CA 91343;
818-892-2068, 805-822-1473.

J = Jefferson ARC, PO Box 73665, Metairie, LA 70033; No phone

K = Koolau ARC, 45-529 Nakuluai St, Kaneohe, HI 96744;
808-235-4132

L = Laurel ARC Inc., PO Box 3039, Laurel, MD 20709-0039;
(d) 301-572-5124, 301-317-7819, (n) 301-588-3924

M = The Milwaukee RAC Inc., 1737 N 116th St, Wauwatosa, WI 53226;
414-774-6999. Test fee for 1993 is $5.00.

H = Mountain ARC, PO Box 234, Cumberland, MD 21502; 304-289-3576

P = PHD ARA Inc., PO Box 11, Liberty, MO 64068; 816-781-7313

R = Sandarc-VEC, PO Box 2446, La Mesa, CA 92044; 619-465-3926

S = Sunnyvale VEC ARC, PO Box 60142, Sunnyvale, CA 94088-0142;
408-255-9000

T = Triad Emergency ARC, 3504 Stonehurst Pl, High Point, NC 27260;
919-841-7576

W = Western Carolinas ARS VEC, 5833 Clinton Hwy - Suite 203,
Knoxville, TN 37912-2545; 615-688-7771.
The 1993 Test Fee is $5.60.

5 = W5YI-VEC, PO Box 565101, Dallas, TX 75356-5101; 817-461-6443
The 1993 Test Fee is $5.60.

1027. Repost - US License Examination Opportunities Scheduled 8/18/93 to 11/29/93

Newsgroup: rec.radio.amateur.misc
Date: 1993-08-23 13:12:54 UTC
From: bjahnke@arrl.org
Message-ID: <5466@bjj>
Source record: 277399
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: Amateur Radio licenses usually arrive between 8 and 10 weeks after the test session. The FCC considers their processing time to be 90 days--from the date they receive the application. The FCC usually receives the application one to two weeks after the test session (once the VE Team and the coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a Morse code test) will not receive a new license from the FCC. The existing Technician license plus the CSCE conveying the Morse code test credit is the only documentation issued for use of the additional HF privileges.

****

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Electronic mail may be forwarded to the ARRL/VEC via USENET at "bjahnke@arrl.org" or via MCI Mail to MCI ID: 215-5052.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials. Electronic mail may be forwarded to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to

MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
